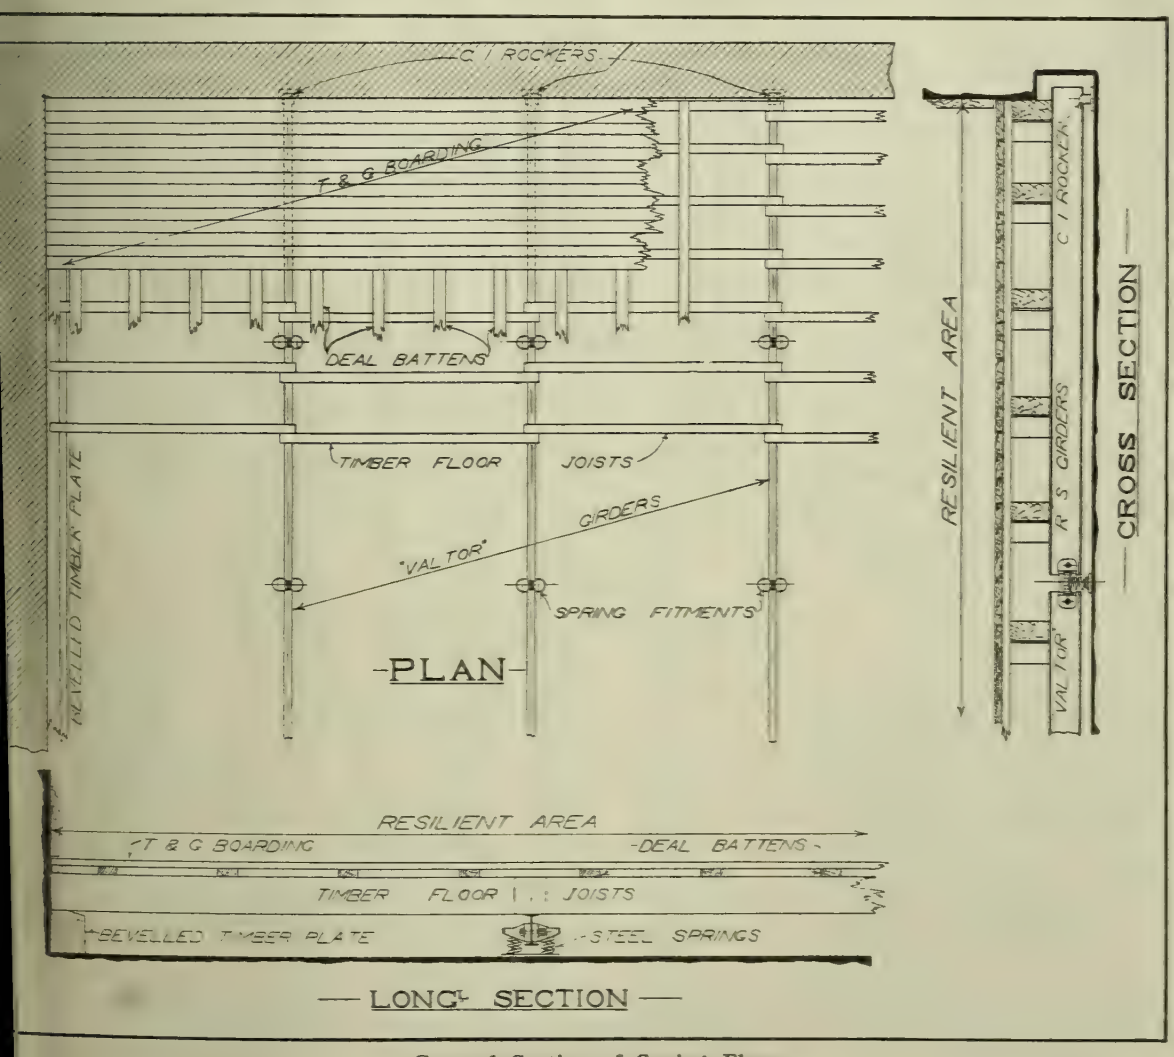
The B.E. has agreed to the scheme for adapting the public library buildings for technical school purposes. Sanctions have been given to loans of £2,120 for a concrete wall by the side of the river Foss.



FIRE.

BURTON-ON-TRENT.—Damage estimated at £30,000 was caused by a fire which destroyed one of the warehouses of the English Grain Co.

SPRING FLOORS

An installation of the patent "Valtor" spring system of resilient floors consists of rows of light steel "Valtor" girders lying across the room under the floor, each line being divided into short lengths coupled together by the patent spring fitments. In each spring fitment there are two helical springs carried upon cast-iron bases and supporting two cast-iron casings bolted to the "Valtor" steel girders. Where depth permits, the timber floor joists are cut into short lengths spanning each bay, and rest loosely upon the top flanges of the "Valtor" steel girders. To the tops of the joists are nailed deal battens, and to these, in turn, is secured the boarding, which, in a resilient floor, is recommended to be in straight, narrow widths $\frac{7}{8}$-in. finished thickness, tongued, grooved and secretly nailed to the battens. The whole structure of the floor is tied in each direction by the boards and battens respectively, and rests entirely upon steel springs, there being no dead point anywhere over the resilient area.

The general sections of a floor of the above character, of which Messrs. Francis Morton, Junior & Co., of 22, Laurence Pountney-lane, E.C.4, are the proprietors, are illustrated on this page. In floors where depth from finished floor level to supports is restricted for structural reasons, Messrs. Morton's have other methods of dealing with the problem. By the use of tee-section "Valtor" girders and closer spacings of the spring fitments, the necessary depth can be reduced to as low as $6\frac{5}{8}$ in. The automatic locking gear, by which a floor can be rendered rigid or resilient as required for various purposes, and which was invented by the present head of the firm some years ago for a floor in one of the large London hotels, is adaptable with the patent "Valtor" system in most situations and, from recent developments, can be brought into play in a floor where the total available depth from floor to supporting concrete is only $8\frac{1}{2}$ in. In situations where it is necessary to distribute the weight of the floor as much as possible, Messrs. Morton's have other designs with both elliptical and helical springs, which, however, there is not room to illustrate on this occasion.

General Section of Spring Floor.

PRICES CURRENT OF MATERIALS

HALL.—Operations have com- nnection with the erection of a new ear Ashton U.F. Church. A site en at Ladybank.

THS.—The question of providing washhouse has again been revived mmittee of the Baths and Wash- ittee have gone into the matter. ecided to visit several suggested nection with the scheme.

THE SCOTTISH BUILDER

SCOTTISH ROADS

It is interesting to note, in view of the big scheme to drive a road between Edinburgh and Glasgow at a cost of about three million pounds, that part of this route is over the ground where road-making on a big scale, for the period, was done for military purposes by General Wade, nearly 200 years ago. General Wade will perhaps be best remembered for his roadmaking activities in the Highlands. At the time it was written :—

"Had you seen these roads before they were made,
You would lift up your hands and bless General Wade."

In 1726, General Wade commenced the construction of the Highland roads with the aid of the soldiers under his command. The task was pushed on rapidly for eleven years and nearly 250 miles of good roads and about 40 bridges were built. A main route, "The Great Highland Road," connected Inverness with the south, going *via* Dunkeld and Blair Atholl. This was joined by a subsidiary line from Perth and Crieff. Another ran by the south side of Loch Ness and connected Fort William, Fort Augustus and Inverness.

A branch from the Great Highland Road was driven across the alpine slopes of Corrieyairack to Fort Augustus, and though to-day it lies grass-grown and decayed, it remains an impressive memorial to the skill of Wade's engineers. General Wade is commemorated in Westminster Abbey by a monument, the work of the sculptor Roubiliac. This is situated over the Canon's door.

Smokeless Fuel.

Plant for the manufacture of smokeless fuel is being erected at Dalmarnock Gasworks, belonging to Glasgow Corporation. This is the first instalment of Glasgow's effort to replace raw coal in domestic use by a smokeless form of fuel. A paper on the subject was read at the Smoke Abatement Conference in Manchester recently by Mr. Robert Maclaurin, manufacturing chemist, Glasgow, the inventor of the process.

New Tweed Bridge.

Messrs. Holloway Bros., London, have secured the contract for a new bridge over the River Tweed at Berwick, at a cost of £122,900.

Steel Houses.

The East Lothian County Council recently had before them the views of a deputation who recently inspected steel houses at Glasgow. Sir A. Buchan-Hepburn, Bart., spoke favourably of Lord Weir's house, which, he said, was given at a definite moderate price, and included foundations. He thought they might try the experiment of purchasing two of the houses for the Eastern district to be used for workmen. Bailie Fish, Dunbar, from the point of view of an engineer, said that the oxidation and corrosion of the foundations were serious matters, and might in the course of a few years affect the strength of the houses. Further consideration was remitted to the Housing Committee.

Greater Edinburgh Lecture.

The success of the lectures on Greater Edinburgh, arranged last winter by the Education Authority, has led to the arrangement of a similar course this year. Mr. Stuart Pilcher, Tramways Manager, will speak on "Some Transport Problems in Greater Edinburgh"; Mr. Ernest A. Savage, Principal Librarian, on "Some Possible Library Developments in Greater Edinburgh"; Mr. Horsburgh Campbell, Director of Housing for Edinburgh, on "Housing: Its Social, Civic, and Educational Relations"; Dr. Blaikie on "King Arthur in Scotland"; Professor Hannay on "Edinburgh and the Scottish Parliament"; and Sir John Lorne MacLeod will give a sketch on "The Making of Edinburgh." The last lecture will be delivered by Professor Grierson, his subject being "Greater Edinburgh, an International City."

Roslin Housing Scheme.

A meeting of the Lasswade District Committee of Midlothian County Council was held recently in the County Rooms, Edinburgh, Mr. Charles Buchanan presiding. The Housing Sub-Committee reported that the Scottish Board of Health had granted an extension of the time within which the Roslin housing scheme could be completed for such period as might be found necessary on condition that the local authority continued to use every endeavour to ensure that the work was completed expeditiously. They reported that the work was now well advanced, though the painter work and fencing had still to be executed. As regarded the roadmen's houses, it was reported that there had been considerable delay owing to the difficulty in obtaining bricks, and now owing to the scarcity of plasterers, but that the architects anticipated that the houses would be all completed by the end of the year, or early in January.

Bricks from Germany.

It has recently been stated that the Works Committee of the Hull Corporation has placed an order, accounts vary from one-half to one million for German-made bricks, to enable them to proceed with their housing schemes, which have been retarded, it is reported, owing to the inability of British makers to cope with national requirements. Two hundred thousand of these bricks have arrived.

According to the Hull City engineer the German bricks purchased cost 50s. per thousand, but British manufacturers state that by the time they have reached the housing sites they will have cost 80s. per thousand. A manufacturer within fifteen miles of Hull states that in July last he offered the Corporation a million bricks at an average price of between 63s. and 65s. per thousand, rail or wharf. Stress is laid on the alleged inferior quality of German bricks.

DING TRADE WAGES IN SCOTLAND.*

BISHOPSTOKE.—For alterations at The Mount, for the Hants. C.C. Mr. A. L. Roberts County Architect, The Castle, Winchester :—

*J. F. Gamble, Lyndhurst £3,619 15 10

BOURNEMOUTH.—For repairs and redecorations, &c., at the various schools, for the T.C. :—

*Grounds & Newton—Westbourne Council school	£269	0
*Bailey & Sons—Bournemouth school	263	10
*Jenkins & Sons, Ltd.—Moordown C. of E. Girls' school	195	0

BOURNEMOUTH.—For addition to bowling pavilions (*a*) Winton pleasure ground; (*b*) King's Park ground, for the T.C. :—

*J. Drewitt & Son ..... (*a*) £385 (*b*) 459

BRADFORD.—For construction of banking premises at the junction of Marlborough-road and Manningham-lane, for the Bank of Liverpool and Martins, Ltd. Messrs. B. D. Fairbank & Son, architects, Bank-street, Bradford :—

Masons' work—*M. Booth & Sons, Bradford.
Joiners' and bank fittings—*Wilkinson & Dawson, Bradford.

BRISTOL.—The following contracts have been made for the erection of houses on the Knowle Estate, for the T.C. :—

A. W. Norris— 18 non-parlour—12 at £380 each, six at £385 each; 18 parlour at £430 each	£14,610
A. J. Miller— 12 parlour at £420 each	5,040
Leonard & Thompson— 10 parlour at £420 each	4,200
C. Malone— 18 non-parlour—10 at £395 each, eight at £400 each: 20 parlour at £430 each. Extra for foundations over site of pond, £30	15,780
Total	£39,630

BROXBOURNE.—Rebuilding bridge over the New River, for Herts C.C. :—

W. & C. French, Buckhurst Hill	£2,369	16	3
P. R. Paul, Waltham Abbey	1,977	2	2
*A. E. Farr, London	1,705	11	6

BURNTWOOD.—For erection of two pairs of houses, for the Mental Committee :—

*J. Morgan & Sons, Stafford £3,074

CAERPHILLY.—For erecting a ferro-concrete footbridge over the Rhymney River at Pontypandy-terrace, Caerphilly :—

*Watkin Williams, Caerphilly £350

CHELTENHAM.—Construction of meter house, ferro-concrete tanks, and other works, for T.C. :—

*Wm. Drew £3,788 10 4

CLIPSTONE.—Erection of school, for Notts County E.C. :—

*A. Eastwood & Sons, Warsop £17,150

CROYDON.—For erection of 34 houses and 14 double tenements in Thornton-road, for the T.C. :—

†Walter Jones & Co., Ltd., London £31,959

DEWSBURY.—For the construction of 14 percolating filters and construction of equalising tanks at Mitchell Laithes Sewage Works, for the Corporation :—

*Provincial Construction Co., Ltd., Sunderland £7,099

GUILDFORD.—Pewley-hill improvement, for the T.C. :—

*Streeter & Co. £9,049

GUNTHORPE.—Formation of embankments for the southern approach road to the proposed new bridge, for the Notts. C.C. :—

*H. Coxhead & Co., Middlesbrough .. £15,761

HARWICH.—Erection of electricity sub-station, for the T.C. :—

‡Fisher & Woods £700

HAVANT.—For repairs to the Town Hall roof, for the U.D.C. :—

*Rogers Bros. £115

HERTFORD.—Alterations at Shire Hall, for Herts C.C. :—

*F. Hitch & Co., Ware £1,495

HUNSDON.—Erection of elementary school for 120 children, for the Herts County E.C. :—

*Rooke & Son. Saffron Walden £4,179

ILKLEY.—For erection of 24 houses, parlour type, for the Ilkley U.D.C. :—

*W. J. & R. Turnbull & Sons, Leeds: £575 per house.

LEEDS.—Extension of circulating pumphouse at generating station, for T.C. :—

*H. Atkinson & Son £13,234

Steel work—
*Samuel Butler & Co., Ltd. 825

LEEDS.—For erection of Baptist Chapel at Southparade, Headingley. Messrs. Jones & Stocks, architects, Park-row, Leeds :—

Mason—*T. Ullathorne & Sons, Selby.
Asphalter—*Tunstall's Rock Asphalte Co., Ltd., Leeds.

LONDON.—For constructing an underground convenience at the foot of Blackheath Hill, for the Greenwich B.G. :—

Griggs & Son, Westminster	£3,495	0	0
Wm. Mills & Sons, Ltd., Blackheath	3,389	0	0
H. Kent, Hither Green	3,190	0	0
G. B. Farrar & Co., London	3,158	0	0
B. Finch & Co., Ltd., Lambeth	3,059	0	0
Douglass, Halse & Co., Ltd., Woolwich	3,034	6	7

[Having regard to the amounts of such tenders, the Committee has again considered the report of the Borough Engineer as to the cost of carrying out the work by direct labour, in which the opinion is expressed that a fair figure for this purpose would be approximately £2,200.]

LONDON.—For repairs and reconstruction of premises 50, 52, 54 and 56, Sirdar-road, for conversion into 12 flats :—

T. W. Heath, Ltd.	£6,892	0
W. Nash	6,261	0
G. N. Watts, Ltd.	5,968	0
J. Poole & Son	5,919	0
*B. Colley & Sons, Ltd.	5,863	7

LUTON.—For erection of an administrative block and cubicle block at the Infectious Diseases Hospital, for the T.C. :—

†E. Pryer £7,529

MANCHESTER.—Construction of "Unicorn" Hotel, in connection with Church-street improvement, for T.C. :—

*H. Matthews & Sons, Manchester.

MERTHYR.—For extension of No. 6 female ward at the Infirmary, for the B.G. :—

J. Williams & Sons, Merthyr	£3,594	14	8
D. Jones & Son, Dowlais	3,325	9	10
N. Moss, Merthyr	3,192	0	0
E. P. Davies, Dowlais	3,120	0	0
*J. T. James, Merthyr	3,030	10	0

The architect's estimate is £2,950.

MEXBOROUGH.—For erection of 40 houses, for the U.D.C. :—

*G. W. Meanley & Son, Ltd. £18,280

MIDDLESEX.—For proposed alterations and additions at Court House and Polytechnic, Tottenham, N., for the County Council of Middlesex, from plans prepared by Mr. H. G. Crothall, F.R.I.B.A., County Architect :—

W. J. Maddison, Ltd., Minories	£3,026
C. J. Newby & Bros., Southgate	3,014
A. Fairhead & Son, Enfield, N.	2,934
G. Groves & Son, Tottenham	2,906
W. Lawrence & Son, Ltd., Finsbury-square, E.C.	2,905
H. Knight & Son, Tottenham, N.	2,880
G. Godson & Sons. Ltd., Kilburn-lane, W.10	2,809
A. Porter, Ltd., Tottenham, N.	2,793
A. Monk, Lower Edmonton, N.	2,735
‡J. Stewart & Sons, Tottenham	2,682

NETHERFIELD.—Provision of lavatory accommodation at elementary school, for Notts C.C. :—

*G. T. Tegerdine £300 15

NEWPORT (ISLE OF WIGHT).—For erection of two pairs of houses, for the T.C. :—

A. P. Williams	£918 per pair
E. I. Hayles	900 ,,
T. E. W. Phillips	810 ,,
*H. E. Day & Sons, Cowes	798 ,,

PORTRUSH.—For erection of 10 houses, for the U.D.C. :—

†J. Frizzell, Portstewart	£3,650
Surveyor's estimate	3,500

PRESTON.—For erection of 50 houses in Miller-road, for the T.C. :—

*W. Markinson, Ltd., Horwich—			
Two houses	each	£475	0
Eight houses	,,	472	10
*Levi Yates, Preston—			
Two houses	,,	470	0
Eight houses	,,	460	0
*J. C. Barnes—			
Ten houses	,,	481	0
Twenty houses	,,	475	0

ROTHERHAM.—For erection of 200 houses, for the T.C. :—

†T. H. Barker & Sons, Loughborough.

SHEFFIELD.—For the erection of transformer sub-station in Crookes, for the T.C. :—

*H. C. Hornbuckle £1,037 3

Department of Overseas Trade.

The commercial secretary at Athens reports that tenders will shortly be invited for the building of a theatre, restaurant and other works in Salonica and the demolition of certain old buildings there. United Kingdom firms desirous of obtaining further particulars should apply to the Department of Overseas Trade, 35, Old Queen-street, London, S.W.1.

Chalk-Brick Houses.

Mr. A. T. O. Quick, of 60, Bardon Chambers, Infirmary-street, Leeds, writes drawing our attention to the possibilities of chalk-bricks for house building, and has sent some photographs of the buildings erected with this material in France on the pin and panel system, with hollow bricks, 10 in. by 10 in. by 2 in. The bricks are made of chalk and cement in the proportions of 12 to 1, and we are informed have a crushing strength of 2,110 lbs. per sq. in. Mr. Quick says: "What was done in France can be done in England. In the chalk areas of chalk-and-cement bricks could be great success to help to overcom difficulties and provide work for a la of unskilled men in preparing the Chalk-brick houses with steel fra provide houses pleasing in appearanc proof and considerably under the cost day houses."

JOURNAL FOR THE ARCHITECT AND CONSTRUCTOR.

WITH WHICH IS INCORPORATED "THE BRITISH ARCHITECT."

L.—No. 4268. NOVEMBER 21, 1924.

THE PALACE OF ART, WEMBLEY

THE large numbers who visited this exhibition helped to show that there is a real interest for art in the general public, and it is instructive in an exhibition so comprehensive to consider what are the prevailing impressions to be gained from it. In the art of ast we perceive that each great period has received its us from the prevailing beliefs of the time, and after the nation the home, the civic life and domestic art occupied lace of the earlier more ecclesiastically-inspired inter- ions. In the multitudes of examples shown in the of Art it was difficult to connect the expression, or subject , with any such governing impulse, and its eclecticism s distinguishing feature, while its attachments to life elief were not of much account. This raises issues of reat moment in considering the present state of Empire There has been, over a considerable number of years, a ning of the scope of subject matter, to include in it new logical manifestations—abnormality as well as the ugly. ere is, however, another view of the matter which claims s the active principle in religion is beauty, so this applied creative arts finds their beauty to lie in the right com- n of things themselves beautiful. When that attitude ceased to govern, it was gradually replaced by repre- on, and the externals of craftsmanship applied to the ation of things not in themselves beautiful. The field entation thus gained in variety what it lost in direction. on, therefore, becomes of paramount importance and e determined by what we find best in life. For the of art is not that of nature, though reached through its tion; and it appears to us that only in exceptional and there were certain notable exceptions—was there riation in this exhibition from the level of naturalistic g. in which nature is seen to be the raw material for ftsmanship rather than for our affection. In the sculp- lleries we saw, however, another influence, less desir- hat of the grandiose, the endeavour to lift the common- f unendowed approach by violent exaggeration of action. ce through this gallery revealed sculpture figuratively g on its head, in a violent commotion of strained bodies, nd arms, much in need of the drill sergeant. And it nost as though we entered into another world, to find all this hurricane, a figure so tranquil, so charming, and noble as the statue of a girl (bronze) by David MacGill. was more comprehension in this one statue (for does it lude the type of all noble maidenhood ?) than endless t or narrative could embody, and it may be regarded as sonification of an ideal—but it was more than this: it eek, Italian, modern, in that it gathered up all that at e has been included and so belongs to all time.

as been so truly said, the artist always paints himself— nobility, his own affections, his own character—and it e more noticeable that so large an amount of the work hardly revealed him at all. It was seen so vividly in the galleries that we were looking at the craft of painting nd that the art was somehow not there.

e passed to the galleries representing Indian Art, we o statues, "To the Temple" (plaster) and "To the (plaster), by S. G. Mhartri: the former in its own way and beautiful as Mr. MacGill's statue was in another, the latter embodied a more developed culture in that er beauty becomes reincarnated from the physical, dominates more in Mhartri's work. There was a quite able significance in this little figure at a time when the Europeanising of Indian art is proceeding, and it exemplified the fundamental differences of national character in the preservation of which, whether for England or India, is contained the security for art. And the difference was not one of technical resources, for the Indian sculptor was as capable of realisation and had as complete mastery of his material as Mr. MacGill. The result, however, emerged in a form as different as is the palm tree from the elm.

The problem of the evolution of the arts, and the preservation of type within them is thus exemplified in a very interesting way. Cosmopolitanism, which reacts with similar effect as has the industrial revolution on industry, tends with disintegrating force to override national characteristics. The patriotic idea replaces nationality, and grasping only at externals like the over-insistence of the State, it submerges individuality: national characteristics and political patriotism being often found, their ideas being destructive of each other, in complete antagonism. There was no evidence of Indian characteristics in the painted frieze recently reproduced in a daily paper by the Indian Society, and what is left where these are superseded ? It has not the virtues of Occidental tradition, and is divorced from its own. Only where this racial identity is preserved can the arts be said to retain any real life. In the Burmese Section the picture "Industry," Burmah, by B. A. Nyan, which might have been the work of any Academy student, exemplified in a startling way the consequences of Europeanising native arts at a time when its industrialism has obscured the true issues. Art can only be encouraged when the spiritual is enthroned above machinery.

The ecclesiastical exhibits were shown in a church built in the Basilica form, so as to provide a setting for the various exhibits. The restless competition of stained glass and altars where there is no co-ordinating idea to unite them, took away the repose that should belong to such surroundings, and was opposed to the objects it had to serve, and it may be doubted whether under such circumstances the best interests of religious art are at all well promoted. It was all, however, on the whole very orthodox, though hardly corresponding in its inwardness with the new spirit in the Church to-day; the emphasis resting on craft with very little compelling human interest. We felt in such surroundings that with any entrance of a more vital spirit, there would go up the cry once again, "Great is Diana of the Ephesians," against new interpretation and life force which threatened its security. The craftsmanship, so far as it went, was all complete enough—if only that were enough—but we are looking to-day for new interpretations to rekindle the life spirit and relate it all to human welfare.

The Bishop of Liverpool, when speaking in the Cathedral on a recent occasion, declared it open to "all men of good will without regard to creed or manner." There was only too evident in the examples shown an over-emphasis of manner at the cost of content. While there has been so much talk in recent years of craft ideals, how many, we wonder, of the stained glass windows were painted by the artist himself ? Yet how slight is the hold on intimate expression where this is not the case, and treatment is so little regarded that it can be delegated in such a way. It is not a question of what was done in the past; the present age calls for a conviction, deepened and strengthened from what has gone before, if art is to do its part, and there is danger lest the craftsman should disregard this new spirit in the Church itself which finds life more than art, and the only force worthy to inspire it.

NOTES.

Labour in the Building Trade.

THE *Times*, on the 17th instant, published extracts from an article by Mr. George Hicks in the *Labour Press Service* which contains a defence of building operatives who, he says, are loyally co-operating with the responsible authorities in an endeavour to carry out existing schemes successfully. He complained of "ignorant and often spiteful criticism" of the building operatives, and says that in many minds it is almost an article of faith that building union rules and slackness on the part of bricklayers are jointly responsible for the building shortage, but no attempt is made to bring the objectionable rules to light, and the charge of slackness is repeated in defiance of employers' admissions that production is well up to pre-war standard. We have yet to see the admission of any employer that output is up to the level of what could easily be attained. Mr. Hicks, however, goes on to say that the facts that lend colour to the above charges are the rejection of dilution and changes in building methods that have varied the proportion between skilled and unskilled labour. He approaches this question of dilution at first in a more business-like manner, declaring that the partially-trained man is uneconomic in the building industry, which is the farthest of all big industries from being adaptable to extreme sub-division of labour, and contends that so far as certain kinds of unskilled help might be found economic it is adequately provided by the apprentice. But he soon lays aside this more statesmanlike attitude and goes on to say that obviously the trade union objection to dilution is that it creates a floating reserve of half-trained men who could be "made do with," at a loss, in times of industrial dispute, when the small employer and his sons might carry on with such aid, and dilution is, in fact, a form of union smashing, and is of little use for anything else.

The Public Need.

THIS latter argument rather lets the cat out of the bag, and explains the very narrow view taken by the unions of the national necessity. What could be more futile than such an argument? We have an industry which cannot meet the demand for the product it is engaged upon, there is a certain and increasing demand for what it could produce, and it is under-manned, yet its ranks are not to be increased or any step to be taken to meet the demand except by the slow process of training apprentices! And for what reason? Because in case a labour dispute should arise the men in course of training might not be subject to union discipline! Mr. Hicks concludes his article with a sort of threat to the public: "If the public need is exploited in the interests of a barefaced union-smashing campaign, the reaction will be as calamitous as it is prompt," but Mr. Hicks must use a stronger argument than he has done if he wishes to convince the public who are waiting for houses that the building trade operatives are playing their part. As we have pointed out before, the building operatives are playing a very dangerous game as regards their own real interest in standing in the way of developing a trade for which there is a public need. Other methods will be discovered and the building operative will be superseded, and the union smashing will be not that which Mr. Hicks anticipates and fears, but the smashing of the industry itself by the unions, who are failing to take a long view of things and are concentrating on the reactionary policy themselves. They are living in a fool's paradise, for no nation would submit to their dictation and go without houses to please them, and other men and other methods are certain to be adopted and the building operative must inevitably suffer.

Higher Buildings Again.

LIBERTY, it has been said, is the reward of eternal vigilance, and if the London we know is to retain its traditions of character and not to be violently uprooted from the past, the pressure now being brought to bear will need to be carefully watched. If for no other reason—and there are reasons enough—there are very strong objections to using for further business and residential purposes the centre of London, already so congested. To add to the pressure already existing by attracting many more people to the centre appears to us not to solve any traffic problems, but rather to add to them, and to contradict the aim of those who looked to reduce the pressure on the capital. To coop more and more people up in the congested central area of London, at a time when we believe there is a strong reaction from the belief i high buildings in New York and C on account of the congestion they the reduction of air and sunlight, wi sequent loss of health, is somethin than a prejudice "against the ad development of Central London doubt, on a money computation such buildings would pay; but th other considerations besides pr additional security "upon which cipal loans can be raised." A gre claims from us an outlook of enlightened character if we are t what is owing to tradition and th We trust that the County Counci have shown their appreciation of a view than that of providing "add security for loans," will make hast slowly in this matter, realising tha are other considerations than those utilitarian to be included, whic against the proposals rather th favour of them.

Housing Dangers.

A CORRESPONDENT v "We are accustom recognise the trut cutting our coat a ing to the amount of the cloth, we cannot afford cloth to fall ba fustian. Ideals in building which p us from building, or throw it in arms of the mass producer, hardly the purpose of those who desire us freed from the standardising is so unsightly. The courage to cheap houses may be a better thin the idealism which, in present fi embarrassment, may prevent us building any. We have in mind a h scheme carried out by a local aut which is subject to criticism by arc because the wood-work is very th the construction is not such a secure centuries of existence for it the houses themselves have none t something human and habitable i

Photo: Mr. C. L. Gill, F.R.I.B.A.

Doorway in Rome: Entrance Front Via Sistina.

ance to Vatican Gallery, Rome.

eristics, as a man may appear becomingly dressed in clothes that ot fabricated in Savile Row. We t desirable to press this point of g cheaply—and, therefore, rather arily—and yet not in an altogether ly way. If architects will yield leals for building to the necessities ime, we may be saved the mechan- tandardisation of our housing now threatens us. We seem to little more initiative in the pro- to meet us on rather lower ground he heights of architecture—if it is round—and we may then find that a quality to be found in cheapness, en it is directed by a mind adjusted difficulties of the present time. s real danger that mass production tervene and capture the ground, the architect can offer an alter- at a cost which will enable his appreciation of housing amenities ail."

No itect red."

Mr. Geoffrey Watson, writing in the *Times* of the 17th, reminds us that "No architect, no skilled labour, is required to build cottage y, and never was employed, until thorities stepped into the arena of culative builder." We do not know he speculative builder will say on old that he, who generally worked is own hands, was not skilled. n hardly think of anyone more And as to the non-employment itects, we can only lament that atson should be ignorant of the ion between "building" and ecture," and should fail to realise cottage that is architectural (in ords, comely and pleasing) need more than one that is ugly and monotonous; that the ugly houses of twenty-five years ago, which Mr. Watson seems to admire, were demoralising because of their ugliness; and that the architect's contribution in cottage design is therefore vital to the moral welfare of the community.

St. Dunstan's.

The architect's waste-paper basket must be ample and receptive. Every day it engulfs the obliging money-lender and a dozen patents. Many hands must, however, have hesitated to consign to destruction the circular issued during Armistice Week by St. Dunstan's, asking architects to recommend the door mats being made by 800 ex-soldiers who were blinded in the war. "Every house, factory, warehouse, and building," we are reminded, "requires a mat." St. Dunstan's is peculiarly British; it touches not only the sentiment of patriotic sympathy, but the practical worth of self-help turning out good things. We make no apology for this reminder to those who may too hastily have thrown away the appeal. If they have not the opportunity to recommend the door mats, they may need a new waste-paper basket, and these St. Dunstan's, if we are not mistaken, can also supply.

Road Names.

We note that the Housing Committee has recommended to the London County Council that the reconstructed estate at Hickman's Folly, in Bermondsey, should be called "Dickens' Estate." The principle of giving streets and dwellings names in some way connected with the history of the district is a good one, and will, no doubt, lead to monographs in the distant future on our 1924 inventions. The fact that the estate at Acton Wells was built on a golf course is commemorated in such street names as "Long Drive" and "Brassey-avenue." Just as a name may make or mar a play, so the importance of good street naming should not be overlooked. "Twenty-first-street" and "Twenty-second-street" may be examples of business-like method, but there is little of interest or romance in such titles. Even "Daisy-street" and "Dandelion-road" would provide more character, although haphazard and sentimental naming indicates a sad lack of imagination.

Acoustics.

Mr. Hope Bagenal's researches on acoustics, some aspects of which he outlined in his paper read before the Royal Institute of British Architects on Monday, should be of great value to the architectural profession, for the problem is not confined solely to schools, churches, concert halls, and such-like buildings, but the comfort of the occupants of offices and houses on busy and noisy roads can be increased if the principles of acoustic design be applied. The extent of the acoustic difficulties in the Law Courts was brought home by Mr. Bagenal when he related an incident which happened when he was a visitor there: Complaints had been made of the echo in the room, and the judge mentioned that on a previous occasion the clerk to the court, in taking down evidence, had actually added the echo to the original sentence. It is interesting to remember that the whole of the competition designs submitted for the Law Courts were Gothic, which, Mr. Bagenal said, is the worst possible form of building for carrying the human voice, although the long reverberation often adds to the effect of church music.

Remains of Roman Bridge over Tiber.

GENERAL NEWS

Professional Announcement.

The Smethwick T.C., after interviewing seven candidates for the appointment of architect, has appointed Mr. Seth Stephens, of Birmingham, to the position.

Obituary.

The death has taken place, at Herne's Nest, Bewdley, in his 57th year, of Mr. Mark Round, a retired timber merchant. He was for several years a member of the Old Hill Urban District Council.

The death was announced recently of Mr. Thomas Simpson, 78, builder, of East Dulwich, who was responsible for restorations at St. Saviour's Cathedral, Southwark, the Royal Naval Hospital, Bancroft Grammar School at Woodford Green, and King's College Hospital.

Town Planning in the Malay States.

We have received the third annual report of the Government Town Planner of the Federated Malay States. Part I gives general remarks and illustrations on town planning progress in the Federated Malay States, and Part II particulars of work and development during 1923.

Architects' Estates.

Mr. Frederick Meakin (84), of Windlesham-gardens, Brighton, and late of Martin's-lane, Cannon-street, E.C. (net personalty, £20,813), £24,991.

Mr. John B. Jones, Alexandra-road, Colwyn Bay. Net personalty £1,535; gross, £39,117.

Lectures on Christian Arts.

A free University (Iolscoil na-h Eireann) has, in spite of political divergencies, been established in Dublin. Its programme includes several subjects not dealt with by the other Irish Universities. Count Plunkett, Hon.A.R.I.B.A., the former Director of the National Museum, has already started his course of lectures on Christian Art in the Iolscoil.

Labour Shortage.

Mr. E. D. Simon, speaking recently on housing at the National Liberal Club, London, said that from the day of the Armistice the shortage of skilled labour in the building trades had been the chief difficulty that counted in connection with the housing question. They could build 100,000 houses a year, and the extra 100,000 necessary for meeting the minimum national requirements could not be provided, although there were over a million people unemployed. The question of apprenticeship would have to be dealt with as a business proposition, and he suggested that the matter should be made the subject of a special inquiry.

LABOUR FOR HOUSING

MR. JAMES RANSOME, F.R.I.B.A., of 21, Suffolk-street, London, S.W. 1, writes:—"From the time when the Addison fiasco was first mooted, I have openly expressed my conviction that no solution of the housing problem is possible which does not embrace: (1) the protection and extensive employment of unorganised, untutored and unfettered labour; (2) the suspension of legislation inimical to the natural development of building enterprise. Although this conviction seems to be shared by a great majority of those with whom I have discussed it, I understand that it is not held by some eminent architects whose views have undoubtedly influenced the abortive housing policies of three successive Governments. Insistent pursuit of this ideal is," states Mr. Ransome, "obstructing the building of houses in which men and women could live in comfort, health and decency," and he invites members of the profession who may share his views to communicate with him.

EXHIBITION NOTES

FINE ART SOCIETY.

QUITE head and shoulders in interest above the ordinary kind of exhibition is that of big game paintings and etchings by Mr. Kuhnert at the Fine Art Society. We do not suppose there is another living artist who, with the trained knowledge and experience of first-hand study, can make excellent pictures of big game in its natural haunts in the way these are presented. Though there is a quite dramatic quality in many of the pictures, we do not feel that the representation of real life and character is in any way sacrificed to theatrical effect, and in his telling landscape of "Cyclone Approaching" (17) we feel that the artist has envisaged the real spirit of the desolating storm which is approaching and causing the fright of the terrified skulking lions in the foreground. The little picture of "Roaring Lions at Night" (11) is an excellent piece of tone and colour, which is an additional quality to the fine portrayal of wild life. "Kaffir Buffaloes on the Steppe" (9), "Old Rogue Elephant" (5), "Approaching Thunderstorm" (50), and "Hippopotamus" (51), with the wonderful picture of giraffes (18), might be named as examples of the variety and skill of these paintings, which should be of intense interest and pleasure to all lovers of animal life. The etchings are no less a success than the paintings, and show in many cases a rare combination of virility and refinement.

WALKER GALLERY.

A small collection of etchings by May Shelly includes some successful and interesting work, such as the "King's Lodging, Caudebec-en-Caux" (7) and "The Cloister, Winchester College" (23). One would expect this etcher to be capable of very good work indeed if a certain hardness of effect were less apparent. In the subjects we have referred to this feeling is quite absent. A good show of water-colours by Mr. Romilly Fedden has just opened at Walker Galleries. Virile as much of the work is, we like the artist best in his more subdued subjects, such as Nos. 24, 46, 41, and 49. There is considerable charm of a decorative kind in these low-toned drawings. A good many subjects of architectural interest are included in the collection, one of which is a happy rendering of form and colour in the architectural values of St. Fiacre, Brittany (45).

Housing at Becontree.

The Housing Committee of the London County Council has recommended the Council to proceed with the erection of about one thousand additional houses on the Becontree Estate, to be known as Dagenham (No. 6) section. Another portion of the estate, it is suggested, should be developed. The cost of the two schemes is estimated to be £600,000 each.

COMPETITION NEW

Coventry Wall Tablet.

Designs are invited for a wall tablet placed in the large hall of the King Henry School, Coventry. Sending-in day, Decemb Full particulars from the Headmaster. advertisement this week.)

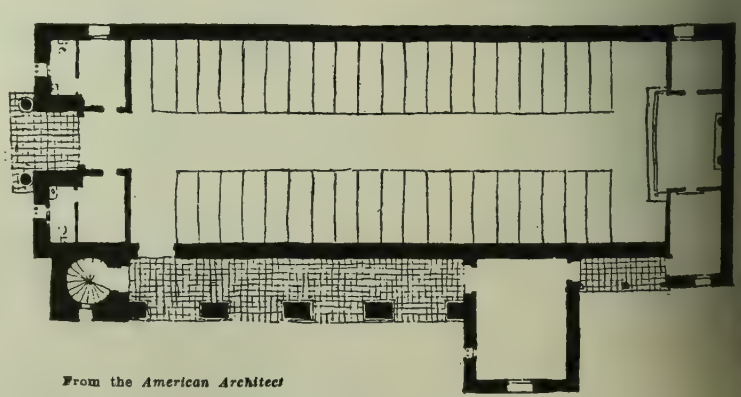
Leeds Library.

Designs are invited for a library to be e at the Compton-road estate. Mr. Pe Worthington, F.R.I.B.A., is the assessor premiums of £35, £20 and £15 are o respectively.

Argentina.

The Argentine Government offers priz 10,000, 6,000, 4,000, 3,000 and 2,000 Arg gold pesos for the best architectural desig a National Institute for the Blind. F particulars are available in the Enquiry at the Department of Overseas Trade, 3 Queen-street, Westminster, S.W.1.

New Church and Hall.



The assessor, Mr. Stanley Hall, F.R.I. has placed the design by Mr. W. M. Keesey, A.R.I.B.A., of the firm of Messrs. K Fleming & Keesey, first in the compe for a new church and classrooms at O street, Leicester-square. We illustrate design this week.

Valletta Lay-out Competition.

Designs are invited for the lay-out o open spaces and fortifications between Va and Floriana and those encircling Flo Applications for particulars, with a depo £5, to be made to the Minister of Public W Public Works Office, Valletta, Malta, not than December 1. Premiums of £1,000 and are offered to the first and second compe respectively. An indemnity of £100 wi awarded to three other designs showing spicuous merit. Sending-in day, June 30, Conditions can be seen at this office. assessors in this competition are Mr. Warren, F.S.A., F.R.I.B.A., and Pro Patrick Abercrombie, M.A., A.R.I.B.A.

Other Competitions.

Other competitions still open includ following (the dates given are, first the send date, and second the issue of *The Buil* which full particulars were given):—M Hall (May 1). Manchester Art Gallery (Fe Aug. 22). Essays on Ventilation (no se in day announced; Oct. 31). Offices at bi (Feb. 28, 1925; Nov. 7). Barrow Hill —banned by R.I.B.A. (no sending-in Nov. 7). Jugo-Slav Landscape (Dec Nov. 7). Church at Southport (no send date; Nov. 7). Southend School (no send date; Nov. 14).

ARCHITECTURAL EDUCATION.—I

By W. S. PURCHON.

The First International Congress on Architectural Education, organised with such outstanding success by the Royal Institute of British Architects, is over, but if we take the right view its work is surely just about to begin. One of its greatest achievements is surely the fact that it has imbued us with a spirit which will not let us rest satisfied until we have completed our investigations, found the weak points in our methods, and set about the task of putting our schemes into thorough order. If we are prepared to consider that the Congress started a great work which we shall be proud to complete by patient effort, then indeed will its success be demonstrated to the full.

The investigation of schemes of architectural education is no easy task, not even for the youngest of us, requiring as it does such breadth of judgment, such philosophic detachment. Most of us tend to approach the problem with the methods of one school, or of one system of education, uppermost in our minds, and in judging the work or the schemes of others we may miss the finer points of their efforts entirely; that which we praise may, indeed, be just what those responsible would condemn.

In the notes which follow, the attempt has been made not so much to indicate a single solution to the problem, but rather to put forward points for and against a variety of methods, and to indicate various tendencies in diverse schemes of architectural education.

In attempting any sort of investigation of the varying methods of architectural education, it will surely be wise to decide first the nature of our aims. Much discussion in the past has lost a great deal of its value because of a failure to clear up this preliminary point. Nor are we helped much if told that the object of all professional architectural education is the production of architects, and that such an education should be continuous throughout the lifetime of the student, who on his deathbed will still, doubtless, be clamouring for information. It will, perhaps, save time if we decide to discuss, except for special purposes, the first five years of professional training, and to consider the sort of result we wish to achieve by the end of that time. Is it, for instance, our desire that after five years' work the student of architecture shall be of absolutely maximum immediate use as an assistant in an office? If so we should still desire to know whether he would be required to act as a sort of general utility man, or whether he would be wanted as a kind of specialist, as, for instance, in the preparation of competition drawings. Or it may be that we are thinking of turning out men who are as nearly as possible capable of running a small practice, and to that immediate end we might be prepared to sink all other considerations. Again, it may be necessary for us to cater for more than one type of student. Opportunities for specialisation are given in one at least of our schools, and it may possibly be that still further options should be available.

On the other hand we might, to use Browning's language, decline to "draw a circle premature, heedless of far gain," and decide on the attempt to produce men with a wider and richer general and professional culture, who would doubtless be less well fitted for immediate architectural responsibilities but who would be more able, after obtaining further practical experience, to hold their own among cultured men not only of their own but also of other professions, and to stand out, if necessary, against passing changes in architectural fashions. Such men would probably not specialise in their professional training.

It might, perhaps, be well to have such thoughts as these in mind in considering the relative advantages of school and office training, the varying methods of the schools, and the influence on the schools of the requirements of professional bodies.

Very closely connected with this question is that of general education for the architect. Years ago the Royal Institute of British Architects had a preliminary examination, and wisely they abandoned it, so that at the present time, in order to be registered as a probationer, the budding British architect must show that he has passed a recognised examination in certain subjects, or produce other evidence to prove that he has reached the required standard of general education. Entrance examinations conducted by the recognised schools are approved for this purpose, the subjects required being English, another modern language, mathematics (arithmetic, algebra, geometry), mechanics or physics, or chemistry or higher mathematics, history and geography, and elementary drawing.

The standard of examination accepted probably fluctuates slightly, but it may possibly be stabilised gradually at or about matriculation level. It is, of course, wise to have a generous number of optional subjects in such an examination, as the main thing to ensure is a reasonable level of general education, and the subjects taken in different secondary schools vary considerably. The main difficulties to be tackled will centre round the standard of the examination and the question of elementary drawing. On the former point there are those who would like to see our students obtaining an arts degree before starting professional education. There is, of course, much to be said for this. The objections are that it places architectural education at a disadvantage in comparison with that required for other professions, such as the medical, that very few could afford to give three years after matriculation to obtain an arts degree and then proceed to a five years' course in architecture, and that, with an arts course as normally arranged, the student leaving it for architectural education might be better fitted to appreciate certain aspects of the latter, but would probably have lost any facility he may ever have possessed with a pencil, and he might also have lost the power to acquire that facility. Similar arguments apply in a lesser degree to a course otherwise eminently desirable, that of staying at a secondary school until the level of the Higher Leaving Certificate has been reached. This normally means two years at school after matriculation. It brings the student to the level of the University Intermediate Examination, and there would be much to be said for it could it be combined with a reasonable training in the necessary elementary drawing.

From the point of view of the training of the architect, an investigation is needed of the art teaching in the secondary schools, and this is really one of the first things to be done. Most people would agree that students starting on a course of architecture need a certain facility in freehand and possibly in what used to be known as practical plane and solid geometry. To what extent are these and similar matters really essential, and to what extent is provision made for them in the normal pre-professional education?

It will, of course, be urged that schemes of architectural education must not be limited in scope to those students who have been able to obtain a sound preliminary education; that provision must be made to enable those whose early education was neglected, but who may, nevertheless, become worthy, or even great, architects, if given the opportunity. No special courses of instruction are arranged persons in, say, the medical profession may be that the best solution of a which certainly requires careful consi lies in the direction of giving such ca for the architectural profession speci ties for obtaining, at a later age, th sary general education, rather than in ing our schemes of professional educa their benefit.

It is certainly to be hoped that the or lack of system, which has allowed of youths to pass through a sort of tural training only to discover, wha to have been insisted on when they proached an architect, that they mu again and pick up some elements of education.

If, however, it is agreed that norm student will begin his professional e after reaching approximately the sta matriculation, and that in some way opportunities will be given him to acqu little facility in elementary drawin reaching that stage, the question may raised as to the necessity or otherwise to continue some form of general e side by side with his professional trai

In the old days the Universities ap felt that architecture alone did not p sufficiently broad education to warr award of degrees, a decision arrived sibly in the main because arts degre the ones normally sought. As a students in architecture had to purs tically the whole of a normal arts co their first year, and in some cases rangement still obtains. The disadva this method is the large amount of tim from the student's professional work first year, and the alternative of subs the study of one ordinary arts subject of the first two years of the course h suggested. Elsewhere, however, it h felt that a well-devised scheme of a tural training following matriculation education of adequate breadth, but th is certainly still open to discussion.

Opponents of the older scheme feel normal arts subjects by no means nec increase the breadth of a student's and it may be that the solution will b not in the addition of such subjects essential to professional efficiency, bu by the introduction of a course desi interest the students of architecture present-day manifestations of another ferably perhaps that of literature.

In that way the young architect only be learning something of another a living art, much as he would doubt those studying for another profession something of architecture, but he wo be put in the way of learning somet the changes which are coming over life, something of the great movement own times, something of the thought greatest minds. And these are which influence our architecture, ir perhaps, and without knowledge of th young architect is to some extent living in a backwater away from the m of human progress.

While dealing with this matter of education reference should also be m the necessity, or otherwise, of the study during the professional course subjects as higher mathematics and no tectural history with special reference and economic conditions in the past sent. It must, however, be clearly mind that the addition of subjects of culture type or of a pure science natur possibly eminently desirable, will in result in the lowering of the t standard reached by the student the first three years of his course consideration of this point is, the most important work immediately the attention of the experts in archi education.

CORRESPONDENCE

chester New Art Gallery Competition.

—I have noted with interest the paragraph ditorial notes of your number of Novem- with reference to the above competition, h mention is made of the "useless system ering" architectural drawings.

not help feeling that the object of render- wings is not understood by those who this strain. The object of rendering, I e, is primarily to explain the modelling of lding, and it certainly enables an assessor e much more accurately of the merits of ign in proportion and massing than do e drawings in which insignificant details '' as heavily as do the lines of main s. We are all familiar with the heavy ition style of line drawings in which the bars form the most interestlng pattern scheme, and the whole is pulled together ick black line several millimetres thick. architects of the past have used ed drawings almost entirely, and I do ppose that Sir William Chambers con- the rendering of his drawings of Somerset vas a useless proceeding.

egards this competition, one feels sym- vith competitors who are called upon to $\frac{1}{8}$ in. details and $\frac{1}{16}$ in. scale elevations. If hes are required surely sixteenth scale ns would be all that is necessary, and if scales are insisted upon the half-inches e omitted.

HOWARD R OBERSON.

Professor Moira on Architects.

—Professor Moira's charming and sug- lecture on "The Building, the Architect Craftsman," at the opening meeting Edinburgh Architectural Association, cently, dealt in a frank and friendly th the difficulties (under present day) of a successful co-operation between hitect, artist and craftsman. His long nourable record of association with our most eminent architects gives him t to express his opinions and gives any pinions great weight. His audience, y, expressed agreement as to the soundness and practicality of his views, but I would suggest that his proposal to adopt certain Swedish and Dutch methods in the education of the architectural student should be very carefully considered before being adopted.

Britain has ever been recognised as sane in its outlook in all matters relating to the arts, and a system which produced such men as Shaw and Bentley (to mention only two who studied extensively on the Continent) should only be superseded after the most careful investigation. Prof. Moira stated that architects did not understand the meaning of tradition as painters understood it, and inferred that most architects were too archæological and antiquarian in their outlook.

History has proved that not only is individual taste but national taste largely developed by the study of the great works of the past, and to suggest that students would acquire a profound knowledge of composition by playing a game of chess with the spacing of two windows and a door in a blank wall seems more than doubtful. The game would soon become standardised. The real solution of the problem seems rather to be for teachers to insist that old examples should not be merely copied but dissected and analysed to determine the structural and organic motives underlying their beauty and perfection. Men with no creative faculty are better inspired by fine old work than blundering into original monstrosities. Great art is great for all time, and can never be out of fashion. As Prof. Moira said, "Mind is what counts, not merely technique, and mind is eternal." We have several notable instances of the work of a revival surpassing in quality the work that inspired it. For instance, the eleventh-century Byzantine mosaics of the prophets in the aisles of St. Mark's, Venice, are, decoratively, finer than the original Byzantine mosaics at Ravenna. If the sculptor and painter took as much intelligent interest in architecture as the architect takes in sculpture and painting we should soon arrive at a greater harmony in the three arts.

Ghiberti, Brunelleschi, Michelangelo and the great men of the Renaissance all spent years studying the masterpieces of the past, and this system has produced the best men of our own time. In decorative work Prof. Moira's own work has something of the largeness of the Venetians with the technique of Velasquez. If decorative artists would follow the architects' lead in this study of old work and analyse the composition, scale, and technique of such men as Botticelli, Perugino, Pinturicchio, Benozzi Gozzoli, Mantegna, Pietro della Francesco, Tintoretto, Titian, Veronese, Leonardo, Puvis de Chavannes, Alfred Stevens and the other masters of the past, and sculptors study Nicolla Pisano, Donatello, Ghiberti, Verocchio, Michelangelo, Della Robbia, and the other masters in the plastic art, as studies in composition, line and scale, the dawn of a new Renaissance would soon appear. Many of our academicians have never seen an antique or an old master outside a museum. To understand such work it must be seen in its relation to architecture.

Architecture is certainly ahead of the sister arts to-day, and is slowly but surely coming into its own. Prof. Moira's great record of achievement makes him a worthy leader, and it is to be hoped that Scotland and Scottish architects in particular will realise the great importance of his appointment as official head of art education in the Northern capital. Scotland has a few decorative artists who understand the principles of design in this department of art, but Puritanism is not yet dead, and the Scots are a parsimonious people in the matter of art, so these men have never had a chance.

WILLIAM DAVIDSON.

Edinburgh.

MEETINGS

MONDAY, *November* 24.

Architectural Association.—Mr. E. J. T. Lutyens on the "A.A. Excursion to Spain." At 34, Bedford-square, W.C.1. 7 p.m.

TUESDAY, *November* 25.

Liverpool Architectural Society.—Mr. C. A. R. Swan on "Relation of the Liverpool Corporation Act of 1921 to Architects." At 13, Harrington-street.

College of Estate Management.—Mr. W. T. Creswell on "Building Contracts." At 35, Lincoln's Inn Fields, W.C.2. 5.30 p.m.

THURSDAY, *November* 27.

Society of Antiquaries.—Ordinary meeting. At Burlington House, W.1. 8.30 p.m.

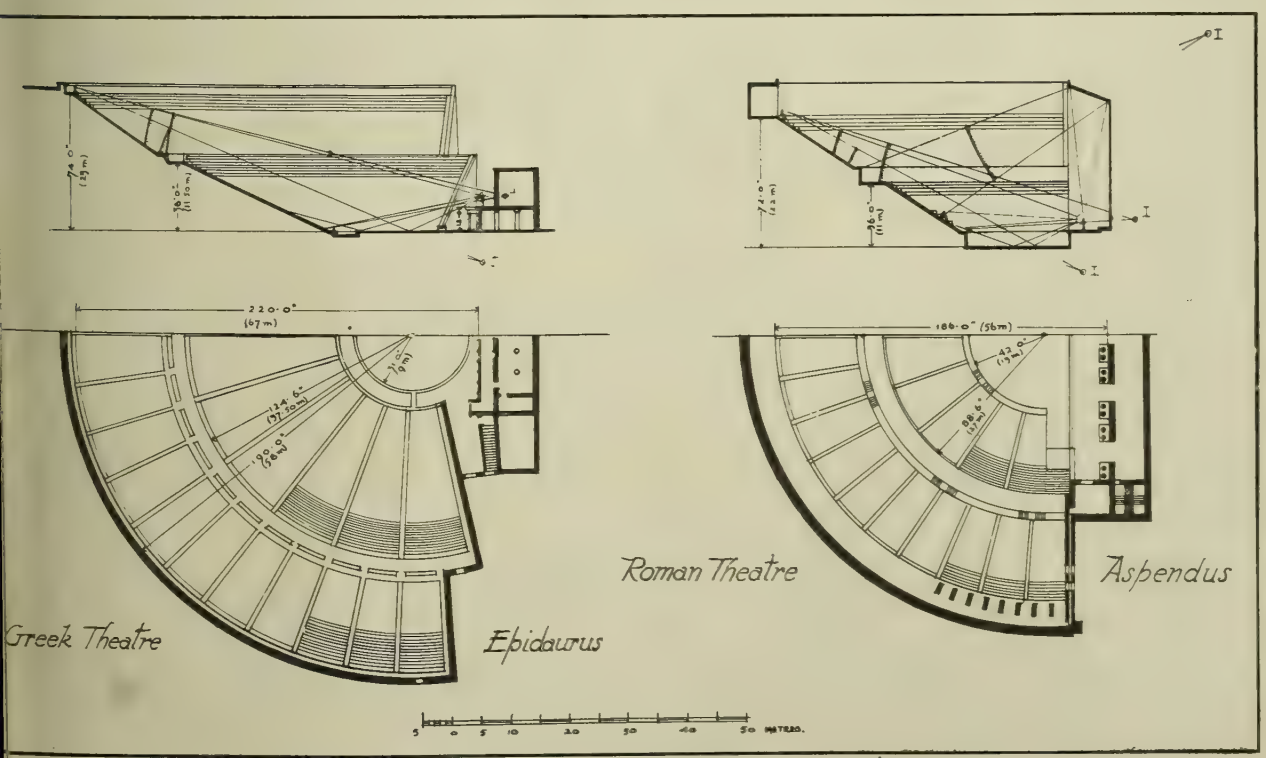

Fig. 1.—Acoustics of Greek and Roman Theatres. (*See p.* 812.)

Mr. J. Alfred Gotch (President) occupied the chair at a general meeting of the Royal Institute of British Architects, at No. 9, Conduit-street, W.1, on Monday evening.

Obituary.

After the minutes of the previous meeting had been confirmed, Mr. Arthur Keen (Honorary Secretary) announced the death of the following members:—E. Seward (Retired Fellow); W. Pywell (Fellow); W. E. Barry, F. A. Brewerton, J. W. Cockrill, F. E. L. Harris, R. B. Mather, T. J. Peters, A. S. Philp, E. H. Rowse (Associates); F. R. Bates, S. R. Bryce, H. Dyball, J. W. Lockhart, W. D. T. Munford, J. Perrault, W. Shaw, C. H. Slatter (Licentiates).

PLANNING FOR GOOD ACOUSTICS.

Mr. Hope Bagenal then read a paper entitled "Planning for Good Acoustics."

In the course of his paper, he said the classic theatre had many vital lessons in acoustic planning. The Greek type was a very highly developed acoustic instrument, the Roman was less excellent. The excellence of the Greek theatre was due to three contributing factors:—

(1) The sound was intensified near the source by a number of useful reflections.

(2) The passage from speaker to listener was kept clear and free from obstacles.

(3) The sound had a clear passage to the listener and reached him at a wide angle.

In Fig. 1 the Greek and the Roman theatres were compared. The characteristics of the Greek were the high, narrow *logeion* or stage platform (conceded to be 10 or 12 ft. high at Epidaurus and Priene); the skene wall behind this; and the large paved orchestra in front of it. The useful reflections from these surfaces were shown on the Greek section (Fig. 1). The small depth of the stage and, therefore, the nearness of the players to their back wall, ensured its efficiency as a reflector. The height of the stage above the orchestra level gave reflections at a useful angle from the paved area below. There was also the floor of the stage giving a less useful reflector.

The height of the stage also gave a wide angle of impact to the direct sound from player to audience. That was specially important when there were no reflections from the ceiling. Sound passing over human heads at a small angle was rapidly absorbed. Therefore, the wider the angle of impact the better. The plan of the classic theatre ensured an equal distribution of sound in all directions, and the section in the case of the Greek theatre was usually without reflecting surfaces likely to cause even local interference. Also, since there was no roof to the Greek theatre the reverberation was nearly as short as in the open air. But the fact that there was no reverberation meant that the energy condition was low. The size of the classic theatres was enormous, seating as many as sixteen to twenty thousand people. The rear seats were sometimes at a distance of more than 200 ft. from the stage. All possible reinforcements were therefore desirable. A method of reinforcing by resonance was probably secured by the following means. The wood floor of the stage in contact with the feet of the player acted as a resonating surface. In addition to the stage floor were the *pinakes* or wooden panels placed between stone columns in the supporting wall of the stage. Each wooden panel in this position would undoubtedly reinforce the sound if in contact with the wooden floor upon which the players stood. The declamation of the players was a kind of rhythmical shouting or chanting, and probably required considerable training. The frequent and sonorous vowel sounds of the Greek tongue, produced as musical tones, conveyed the sense to the remotest seats. Stage floor and *pinakes* together formed the sound-box. The players performed not only upon the *logeion* or stage platform, but upon the *theologeion* above and upon the orchestra below.

These points in acoustic design had a direct bearing upon modern problems. A hard rear wall some 10 ft. behind the speaker might make considerable difference to audibility in the case of a large hall or in the case of a pulpit. The usefulness of the stage floor as a reflector was one of the factors which made the difference between the opera house and the concert room. A concert room would be improved by a clear hard floor space round the singer or solo instrument. It was bad design to bring orchestral instruments or platform seats close up to solo performers. A clear orchestra area immediately in front of the Albert Hall platform would increase the useful sound to galleries.

Wood surfaces could also be used advantageously as resonators. They should be in contact with the singer or instrument. The wood surface of the platform floor should be jointed to the front of the platform, which would then act like the Greek *pinakes;* and the same principle could be applied to the wood panelling of the platform recess. A powerful singer was really an instrument in contact with the floor. Resonating surfaces increased his power: and they were specially useful for musical instruments like 'cellos and double basses.

In the Roman theatre the stage was lower and was brought forward so that the orchestra became a semi-circle. The great width of the classic stage of this shape must have constituted a danger. Echoes would certainly be returned from wing walls. In these walls the *periakti* might have been placed—a series of prisms, triangular on plan, rotating upon an axis and providing three sets of scenery. If the line of these *periakti* was placed at an angle of 45 deg. to the stage, the actor's voice would be reflected out into the hemicycle. In the Roman theatre the orchestra space was frequently used for seats. The reflecting surface thus sacrificed was partly compensated for by the extra floor area of the stage. But an important addition occurs in the Roman theatre from an acoustic point of view, namely, the roof set at an angle above the stage, yet the reflections from this roof would not have given "the consonance" recommended by Vitruvius. The lesson of the classic theatre was: that reflecting plus resonating surfaces *near the source of sound* will work wonders.

After treating on the acoustics of churches, the lecturer dealt with the English Legislative Chamber. The House of Commons, he said, had in course of time produced its own style of utterance, and it illustrated better than any other one important aspect of acoustic design. Its basic principle was debate: and debate had requirements very different from the requirements of stage plays or intoned liturgy. The nature of that kind of oratory was bound up with the building in which it took place. It was necessarily a small building—a college chapel in character. Apparently it was not until the year 1800 that plans for a new chamber were called for by a Select Committee in 1831. But after the fire of 1834 all these schemes were forgotten. The old Painted Chamber was fitted up for the Lords and the old Court of Requests prepared for the Commons. This Chamber in the old Court of Requests was larger than the Chamber in the St. Stephen's Chapel. It was 80 ft. by 38 ft., and in the engraved view given by Brayley and Britton in 1836 it looked some 40 ft. in height. This would have meant a longer reverberation, and acoustic complaints mus occurred, for alterations were undertake view of the interior of the House of Co published in 1841 showed what appeared the same room lined with wood and low ceiling of a special shape. That was as "the temporary House," and famous for its good acoustic qualities. lowness of the ceiling was apparently the ideas of Dr. Reid, the ventilation in whose opinion "the cubic content filled by the voice should be as small consistent with the necessary accommod For that reason he had the ceiling of th porary House made very low, so that should be not much space filled."

Since St. Stephen's Chapel had a ch beneath it, it was apparently necessary that all succeeding Houses should hav same. The chamber beneath the tem House was made to communicate wit chamber above by means of holes drilled wooden floor. The acoustic excellence room, thus transformed, undoubtedly the adverse criticism that occurred whe Parliament assembled in 1848 in Sir C Barry's new House. The conclusio members were quite right. What was at was that facility for rapid debate which not exist with a long reverberation. Reve tion (other factors being equal) varied di with volume, and volume with height o ing. In 1850 a new ceiling similar in to Smirke's (though the effect of the shap probably not understood) was inserted an result was a great improvement. Ba House of Lords maintained its original ce Tradition said that the House of Com before the new ceiling was inserted, was than the House of Lords. After the alte to the Commons all were agreed and were agreed that the Commons was good, wh the Lords was bad.

In the Commons the old habit of debate at conversational pitch was ren easy by the new ceiling. Complaints, ever, arose and still arise from membe the back benches for the following rea The English legislative chamber was not an auditory but also a machine of bus Its excellence in this respect was four analysis (Select Committee House of Com Arrangements, 1868) to consist in the fac Ministers in charge of Bills were nea Speaker (or the chairman of committee) near the Press gallery. A great deal business of the House was done in a vo conversational pitch across the table, Ministers addressing the chair could be heard by the Press gallery immediately the chair. The importance of the Pres obvious. But in addressing the chair the front benches, a speaker had a larg of his audience behind his back. I English system the Speaker was the onl manent audience, and any member's might become a source of sound—unlil Continental system, where every speaker come to a tribune. Hence the periodic mands in modern history to have the and the Ministers with it, moved dow floor to a more central position. By this also the Treasury and Front Opp benches could be increased from the n adequate sixteen seats to twenty-two or t four. The effect of the splayed ceiling concentrate sound on front benches, and the important business of the House w ried on there, this was an advantage; did not help members in the back be The reflected beams of sound from the s portions of the ceiling were shown in concentrating on the front benches and ing the back seats and the galleries. The from the centre level portion covered or seats in front of a speaker. Seats front bench speakers were, therefor provided. This ceiling was construc wood and glass, and was, therefore, efficient a reflector as if it were of hard I If this were the case, and if the slopes ceiling were adjusted, the room could b nearly perfect. The total volume of th

nly 127,000 cu. ft., which was very con-bly less than the French Chamber of ies, 277,000 cu. ft., and the Washington e of Representatives, 409,000 cu. ft. M. Barry, son of Sir Charles, designed a House of Commons at the request of the Committee of 1868. The evidence of Committee was not lost upon him. He ved the shape of the ceiling and actually ed its height. The action of the splay M. Barry's design was more valuable n the existing House. It provided useful of sound from front benches to seats in rear (see Fig. 2). If at any time the of Commons were to be rebuilt, this nt design should be carefully studied. the designing of modern parliament ers, the problem was to provide a plan ircular or semi-octagonal in shape to modern states of opinion, and yet still o dispense with a tribune position for the r. The advantage of a tribune was two-First, a speaker had all his audience in of him, and, therefore, useful reflecting es could be designed to his right and nd secondly, a single direction was given voice, to which he became accustomed. rge Continental parliament houses, all at height, were indeed acoustically work-nainly because a central tribune position ed. Since without a tribune front bench rs had a large number of listeners ir back, the ceiling should always be as a reflector normal to every seat in use; that was to say, flat, and not more 35 ft. in height. A semi-circular or ctagonal plan could be made to supply eflecting surfaces along the diameter the chairman. The requirements of ess should also receive special attention. ve all, it was necessary to design for the eration. As a rule in a legislative cham-e number of persons present was always ely small in proportion to the air volume building. That meant that large areas nanent absorbing material must be pro-in suitable positions in order to com-e for this lack and reduce the reverbera-a figure suitable to the speaking voice. requirements for a good absorbing l were: 1. Cleanliness. 2. Durability. bsorbents available for architects at fell into two classes: first, soft ls requiring a canvas screen; and plaster and tiles. Although he yielded e in his admiration of the American results, direct experiments upon English materials and fittings were most important. The results of the Building Research Board experiments upon British materials fixed exactly as an architect would have them fixed, had already been most valuable. These experiments were undertaken at the request of the Indian Government, at the suggestion of Mr. Herbert Baker, on account of the work at Delhi. The experiments were carried out by Mr. P. W. Barnett, A.R.I.B.A., assisted by Mr. W. H. Glanville, B.Sc., and other members of the staff of the Building Research Station under the direction at first of Mr. H. O. Weller, and now of Dr. R. E. Stradling, M.C., Ph.D. The tests were made to cover the musical scale at octave intervals. Some of the many results obtained could be stated briefly as followed:—

The most powerful absorbent of all (for pitch C4) which an architect could use was slag wool behind wire netting. The efficiency of this absorbent declined rapidly above C5—that was, for higher notes.

The next most efficient absorbent for C4 was Cabot quilt. This material was easy to apply and was hygienic and not harmful to the touch like slag wool. It was slightly resonant. It improved the speaking voice conditions, but would not give the best results for chamber music owing to unequal reinforcing of tones. It was fixed in two layers on 2 in. by 1½ in. battens, 2 ft. 8 in. apart, and had thus a 1½ in. air space behind it.

The next most efficient absorbent was 1 in. hair felt. Felt was found at Harlesden to make, in conjunction with wood, the best conditions for chamber music. But if felt were to be widely used in England it must be made really moth-proof and fire-proof. The felt was also fixed on 2 in. by 1½ in. battens. All these three materials required canvas screening. Of the wall panellings, cork 1 in. thick framed in wood with an air space behind gave fairly high absorption for C4. "Celotex" board was found to be an efficient absorbent and to give excellent results for chamber music. Of the permanent flooring materials rubber carpet 3-16 in. thick was found to be the most efficient.

Owing to the courtesy of Professor Paul Sabine of the Geneva Laboratory, Illinois, experiments were undertaken upon an acoustic plaster using his recipe as a basis. These experiments produced interesting and useful results, and were still in progress. An acoustic plaster was developed causing for C4 at least 20 per cent. reduction in the reverberation of the room. (This figure must not be taken to represent a Sabine co-efficient.) A surprising result of the experiments in this class was the efficiency of coke breeze blocks 2 in. thick. It was shown by the experiments that coke breeze slabs having a finishing coat of acoustic plaster made a very efficient absorber.

The Director of Building Research, Department of Scientific and Industrial Research (Dr. R. E. Stradling), in proposing a vote of thanks to the lecturer, said the Building Research Board owed a great deal to the work of Mr. Bagenal, to whose keenness was due the starting of the investigations of the Board. The work of the National Physical Laboratory and of the Harlesden Laboratory also had a certain bearing on the architectural acoustic problem. The Department of Scientific and Industrial Research had called together a committee of those interested in acoustics to take charge and direct the work on that specific subject, and had been very much encouraged by the visits of the Science Standing Committee of the R.I.B.A.

In seconding the vote of thanks, Dr. Alex. Wood said Mr. Bagenal had contributed more to the development of the study of acoustics than anyone else in this country.

Mr. G. A. Sutherland said the architect must conform to the laws of acoustics in designing a building, and not expect to design a hall which a physicist could make acoustically correct. He suggested that assessors in architectural competitions might lay down some simple acoustic properties which a building should possess, and not accept a design with hopeless acoustic properties, and then try to improve them.

Dr. G. W. C. Kaye said the National Physical Laboratory had taken up the question of acoustics, and it was their intention, with the support of the R.I.B.A., to throw themselves with the utmost vigour into the work.

Mr. Maurice Webb said in the case of large buildings he believed amplifiers had eliminated half the acoustic difficulties; at Liverpool Cathedral there were amplifiers in the ceilings which easily got over acoustic troubles.

Mr. Raymond Unwin said amplifiers were used in the Council Chamber of the League of Nations, and it was almost impossible to discern in the gallery whether the sound came from the speaker or the amplifier.

Entrance Hall to St. James' Park Station.

A description of the entrance hall to offices recently built at St. James' Park Metropolitan District Railway Station, is given on p. 825. Messrs. Richardson & Gill, FF.R.I.B.A., are the architects.

New Science Building, Mill Hill School, N.W.

This drawing shows the building recently opened by H.R.H. the Prince of Wales to house the Science Departments of Mill Hill School. Laboratories are provided for the various branches of science, with workshops for handicrafts, and special provision has been made for experimental work in wireless telegraphy. The structure generally is of brick with hollow block floors, the walls externally being finished in stucco to match the Monks Park stone used in the main entrance. The roof is covered with dark brown tiles. The general contractors for the work were Messrs. Miskin & Son, of St. Albans and London, and the following sub-contractors were also employed: Messrs. Rudd & Co., plaster work; Richardson & Co., iron balconies; Jas. Gray, Ltd., heating; Hendon Electric Supply Co., electric light; Haywards, Ltd., roof lights; Halstead Bros., laboratory fittings. The enrichments to the main entrance door were modelled and carved by Mr. P. G. Bentham, of Stamford Bridge Studios. The bell tower shown in the drawing has not yet been erected, but it is hoped to carry out this work as a memorial at some future date.

The building was designed and carried out under the supervision of Mr. Stanley Hamp (Collcutt & Hamp), 126, Wigmore-street, W.1; the perspective drawing is by Mr. Kenneth Anns.

Houses on Barker Estate.

These houses, the first of a series of groups of different designs, have been completed on some of the front sites adjoining Upper Richmond-road. The whole of this estate is to accommodate over three hundred houses of this type. The brickwork is generally in grey Sussex stocks, with dark sand-faced tiling for the roofs, whilst the windows are in metal casements and leaded lights in stout frames. The builder was Mr. Oliver Kennard, of Cecil House, Westwood-road, Sydenham. The second group, consisting of twenty houses, is now in course of erection at another part of the estate, and the third group under preparation for procedure. Mr. Sydney E. Castle, M.S.A., of 40, Albemarle-street, Piccadilly, W.1, is the architect to the estate.

Competition for a Church and Hall, Leicester-square.

We also illustrate this week the design, placed first, by Mr. W. M. Keesey, A.R.I.B.A., of Messrs. Kieffer, Fleming & Keesey, for a new church, hall, &c., in Orange-street, Leicester-square. The front elevation, Orange-street, has been slightly enlarged from the original scale in order to give a better view of the detail.

ARCHITECTS' FEES UNDER HOUSING SCHEMES

ARCHITECTS are having a good deal of trouble in ascertaining the fees they are entitled to under Housing Schemes. Only last week we published the report of a case where the point was raised under Memorandum No. 4 whether, when more than one architect was engaged on schemes by the same authority the several schemes were to be pooled for the purposes of calculating the remuneration, and a further case, Elkington *v.* Wandsworth Borough Council (the same Council as in the case referred to) is reported in *The Times*, November 13 and 14. As in Mr. Pigott's case (that reported last week), it seems to have been agreed after the first contract that the remuneration was to be governed by Memorandum No. 4 under which the remuneration is to be 5 per cent. on the first 12 cottages, 2½ per cent. on the next 60, and 1½ per cent. on the remainder, and the Memorandum suggests that as a rule one architect should not be entrusted with more than 250 houses.

In this case, Mr. Elkington had been engaged to undertake a scheme involving 400 houses, of which 153 had been completed and 247 had been abandoned. He had been paid certain sums, but was suing for a balance of £3,215 10s. Two contentions appear to have been raised in the case; (1) the plaintiff had claimed the 5 per cent. on those houses for which contracts had been first signed in point of time and these houses happened to be the most expensive; (2) he contended that as regards the abandoned houses, although the Memorandum provided no scale for these, yet it incorporated the memorandum of the Royal Institute of British Architects which construed with Memorandum No. 4 gives the scale, and therefore the remuneration which the plaintiff was entitled to was a question of contract and not a *quantum meruit*, and he claimed two-thirds of what he would have been entitled to had the work been completed.

The contention for the defendants was that under Memorandum No. 4 the proper method of calculating the remuneration was to t whole number of houses built and b several percentages on them. Thus in t the average cost was £737, and it was co that this figure multiplied by 12 would 5 per cent. basis, and multiplied by 60 per cent. and so on.

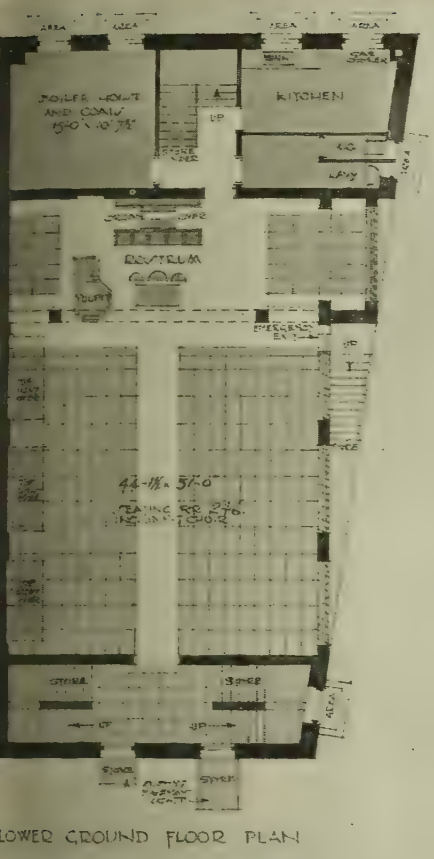
The Court held that the defendants' co was right on this point. On the secon the Court held that the memorandum Royal Institute of British Architects incorporated in Memorandum No. 4 ordinary sense of that term and the tru pretation of Memorandum No. 4 was t memorandum of the Royal Institute n looked at to ascertain what the condi engagement were, but the scale must be t down in No. 4, and as in that memorandu was no scale for abandoned work the plai entitled to payment on a *quantum meru* the parties were unable to agree to th the matter would be sent to an official

It seems very unfortunate that the randum should have been so obscurely w to leave parties in doubt as to their rig liabilities thereunder, and even the judg reported on the second point does not make the construction of the two do very clear to the lay mind, but it appe point cannot arise in subsequent cas memorandum dealing with claims for aba schemes has since been issued. This before us, but we hope it deals with th important point in clear terms on a sc nothing can be less satisfactory than ha determine the amount of remuneration principle of a *quantum meruit*. It is dis to both parties to be forced to litigate q which should be clearly dealt with in th ments regulating such engagements.

The above is only a very short sumn the arguments and the judgment deliv this case.

Corrections.

The correct description of this buil the Eastman Theatre and School of and not as given in our issue of last w



We omitted to state last week, in cor with our notes on Dorland House, that E. J. & A. T. Bradford were responsible stone carving.

We regret that in our list of sub-con for the Shepherd's Bush Pavilion in our l the name of Messrs. The Trussed Concre Co., Ltd., was not mentioned, although, o their material, "Hy-Rib," was used to siderable extent.

Houses on Pages-lane Estate, Muswell Hill. MR. VERNON A. BROWN, Architect

[The Pages-lane Estate will comprise about 60 houses, semi-detached and detached, of three to five bedrooms, garage, &c. The houses are of brick, and in some cases faced with rough-cast. The estate agents are Messrs. Sydney Bowyer & Co., Muswell Hill, and the builders are Messrs. Ellyatt & Co, Colney Hatch.

WESTMINSTER ABBEY RE-EXAMINED—IX

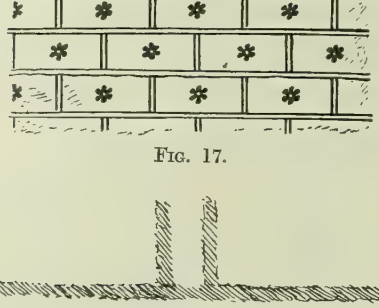
By W. R. LETHABY.

SCULPTURE AND COLOURING.—II (*Continued from p.* 729).

Whitening, gold, and colour.—The purpose of these chapters is to understand and "see" as far as possible how the church was built and what it looked like in its first freshness; sharp, unencumbered, light and undirtied. We must try to gain some idea of the fairness of the exterior—mostly as white as flour, but here and there touched with colour and gilding. From the wide spaces of the interior we must banish the terrific modern monuments, many screens, and the seating which hides the columns as they rise from the once shining floor. We must hold in mind the fact that the church was flooded with light passing through glass which was not only transparent but glittered.

Besides these main conditions the internal effect depended on the large use of polished marble in varying tones of grey; on the whitening and red lining of the whole of the masonry where not otherwise decorated; on a lavish use of gilding; and on the assembling of specially splendid objects such as the gold shrine, the exquisite retable, and the polished porphyry floor—like glass mingled with fire.

At Westminster the remnants of the original decoration are so few and small that it would hardly seem possible to find sufficient evidence for the original scheme, but comparison with St. Albans, Salisbury, and other great churches prepares us in such a way that the merest hints allow of large conclusions. The schemes of decoration of a dozen great churches might now be worked out in quite a trustworthy way. Some who are not well acquainted with these results, when they hear of the tale of white and vermilion, azure and gold, hasten to say that they would not "like it." But the people who did it loved bright things, and students who have come to see just a corner of this field of gleaming beauty are likely to tell us "We like it very much indeed, thank you."



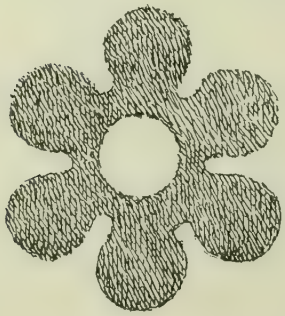


FIG. 17.

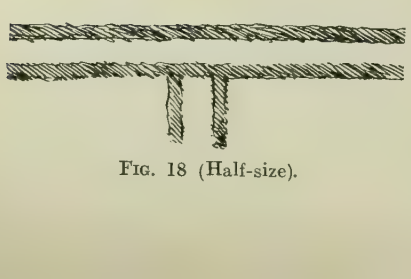

FIG. 18 (Half-size).

Parts of marble columns which have been protected here and there yet retain some of the original polish. A window recess now blocked at the end of the wall passage around the southern apsidal chapels had still, when I saw it some dozen years ago, the stonework covered with the original whitening, red lining, and roses, a precious remnant of the general decoration of the wall surfaces (Figs. 17 and 18). From many orders of Henry III we know that it was the common fashion of the time to whiten walls and divide them up with red lines into spaces of the shape of large bricks with sometimes a simple flower in each. This was called pointing, quarrying, or illuminating. To the roses we have more than one allusion. In 1240 the King ordered that the Queen's chamber in the Tower should be "thoroughly whitened internally and painted with roses." The wall whitening at the Abbey was being done in the year 1253 by Adam the *dealbator* and his mate. Scott knew of the wall decoration. His son, G. G. Scott says: "The interior was whitened and stoned in red lines. The diaper work of the triforium was gilt on a red ground; the sculptured bosses were gilt and coloured."

I have not found any direct proof that the diaper of the triforium was coloured and gilt, except that the diaper in the eastern arcade of the Chapter House still shows traces of gold and red. I have little doubt, however, that the diaper of the apse and presbytery was at least intended to be gilt. Gilding of the interior was one of the ideas taken from the Ste. Chapelle, where the whole interior recalled a goldsmith's shrine.

There are traces here and there that the wall-arcade was painted; in a protected part behind a big tomb in St. Benedict's Chapel the capitals are copper-green and the roll mouldings red. In the bay over the mosaic tomb in the south ambulatory the capitals are gilt, but the painting here seems to be later work. In several places red remains in the spaces under the arches. The shields of arms in the wall-arcade of the Choir must have been painted from the first, as they are at present.

The ribs and bosses of the high vaults of the presbytery and choir are gilt and this has certainly been so from ancient time. Keepe (1683) writes: "The vault whose arches dividing themselves into several squares compose a most stately roof, wrought with divers figured stones [bosses], and in some places curiously gilt with gold." Hatton (1708) says: "The next thing remarkable in the ornament is the gilding of the arches over the chancel, done in gold, which has been of many years' continuance." Wren, in his report on the church, says: "The vaulting of the Quire, though it be more adorned and gilded, is the worst performed." Crull (1713) writes: "You may still perceive that the arches of the roof of this Quire have been richly gilt and are at this time adorning with new gilding as well as the cross aisle [transept] on the south side."

The new gilding was done during Wren's great work of restoration, begun in 1698. In 1700, Samuel Clothier and David Legge, painters, were engaged "painting upon stone in imitation of Sussex marble in the ribs of the two bays and face of the great arch over the choir . . . being first thoroughly soaked in oil." Other items are "Raffled leaves round the 5 roses"; "for laying 5,550 of double gold upon capitals, ribs and roses." The roses are the bosses, the raffled leaves are borders round them on the field of the vault. The latter and bands up the sides of the ribs may be over old painted work. The account for gilding is followed by "The gold beater's bill." Large surfaces of the interior seem to have been covered paint and this may be what was "painting in imitation of Sussex

The sculptures of censing angels the south transept were fully painted is evidence for all the spandrel car 1910 I examined the angel on the a ladder and found red in the crea drapery. On the upper garment was of three spots distributed at interva The right-hand angel had stars on th which are plainly recorded in the Fig. 3. I also have a note of trace Patterning of draperies in this way wa in paintings of this time (see recen "Life of St. Alban"). There was red little lion below the angel on the lef graphs of the angel spandrels at Lin in Prior and Gardner's "Sculptur that they too were coloured and ha square-diaper backgrounds that appe been adapted from the carved square Westminster.

blue. Above the canopies the space in the centre is red while the rest was blue. According to Neale there was much gilding and raised patterns which would have been in gesso.

There are still traces of Catherine wheels of gesso on the elaborate tomb of Lord Bourchier which forms a screen to St. Paul's Chapel; as Neal says, they were "thickly powdered" over the monument and gilt. His engraving shows them and also the band of angels above each holding a pair of painted shields and having gilt wings. This tomb also has lately been cleaned. The cornice and battlement

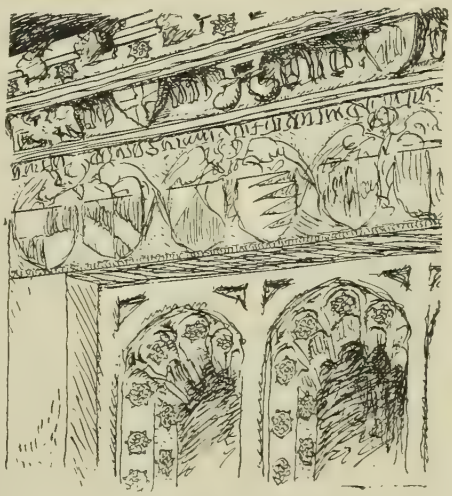

Fig. 22.

were blue picked out in gold, as apparently was the whole work. In the hollow of the cornice between the arms and badges was an inscription in big gold letters: "Non nobis dñe non nobis sed nñi tuo da gloriam," some of which can still be read. Below, on two deep bands, several of the shields can be distinguished with traces of the angels' wings. The bands were edged at the bottom with a fringe like the vallance of a funeral hearse. There was further lettering over the shields, in white on black, which is given in Keepe's MS. as "+ L'onnour a Dieu a nous Merci + " and "+ Learne to Dye to live ever+." These were several times repeated. According to Keepe's drawing the big flags and the Lion and Eagle which support them on either side of the monument were fully coloured and traces of this can still be seen. The sides of the tomb proper have quatrefoil panels with red and green fields alternately, the colours counterchanged on the chamfering. Keepe gives twenty-two shields of arms which he says were of "the nobility both of England and of Henault, viz., Robsert Bourchier, Swinford, Chaucer, &c." (Fig. 22).

The chapels on the east side of the north transept were dedicated to St. John Evangelist on the south, St. Michael in the middle, and to St. Andrew on the north. The Chapel of St. John had a screen which Keepe says was "adorned with several carvings and coats of arms, by John Estney Abbot, painted and gilt with gold, who lies on the south side with his effigies engraven on brass; he died 1438." Dart says the screen was wood finely carved and gilt. The middle chapel still has the ruin of a fine late Reredos. A sculptured figure of the Virgin and Child painted and gilt, a fragment of which now rests in the St. Erasmus panel in the north ambulatory, may have belonged to this Reredos. According to Keepe "the screen of St. Andrew's Chapel was adorned with imagery work of birds, flowers, cherubim, devices, mottoes, and coats of arms." A drawing (dated 1722) of this screen, which Dart says had been destroyed, has lately been presented to the Abbey from the Gardner Collection.

It was of stone tracery with a central door in the spandrels of which were two big crowned eagles holding inscribed labels; above was a blazing sun or rose, and a long inscription on either side of it (Fig. 23). On a handsome carved cornice were arms with trees and inscription ribbons between. Rising from the cornice were two pinnacles. In Keepe's MS. collection in my possession are further details and a copy

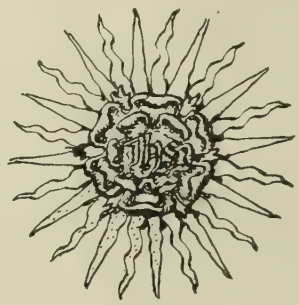

Fig. 23.

of the inscription. The sun surrounded a red rose on the heart of which was inscribed I H S; it was a symbol of the Virgin—*flos florum*. The inscription (Fig. 24) ended with the date 1467. Thirty shields of arms are given; the one in the centre bore the device of the Trinity, two others were the ordinary Abbey arms and the keys of St. Peter impaled with the Confessor's Cross. The birds in the cornice were gilt eagles and black ravens holding labels inscribed *Kyrie Eleson*, doubtless Kirton's motto. (In giving a sketch of this in 1906 I understood the carving to be a wooden cresting, but as now said, it was part of a stone cornice.)

There was much painting of later date in the cloister. Keepe says that at the entrance towards the west was a crucifix with the Virgin and St. John "curiously painted and very pitiful to behold." Round the cloisters were other paintings "with variety of verses alluding to the history of the foundation and the figures." Opposite the walls were "windows of tinctured glass" [in the tracery only]. The description by Allen quoted above goes on to say that the north-west bay of the cloister "has been painted with orange-coloured sprigs on a dark

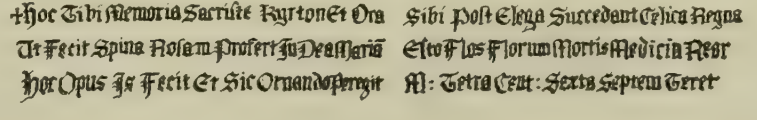

Fig. 24 (Rose was in centre).

ground." In the south-west bay above the entrance are "fragments of black-letter inscriptions on serpentine labels."

A fragment of this lasted on until Micklethwaite's time, who says that above the door, "on the wall just below the vault are a few mouldering elements of a picture" [the Crucifixion ?]. All that can now be made out is part of a ribbon with an inscription in letters of about 1500, which Mr. J. T. Fowler has read with some hesitation, "*in s'cla s'clorum. Amen.*"

As lately as October, 1923, colour was found on the ribs of the cloister vault in the south-east bay—red on the rolls, fair blue in hollows, and a morsel of gold on the boss. It is clear that the whole cloister was as clean and bright as paint could make it.

Feckenham, the restored Abbot, accomplished a considerable work in refitting and redecorating the church. In 1557 the Confessor's coffin was put back in, rather than on, the marble basis. A quite pretty shrine-like structure of wood—recalling in its form the old shrine proper—was set above the basis where it yet remains. The

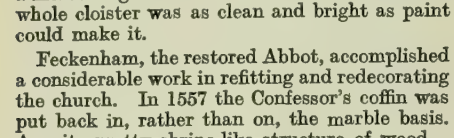

FIG 25.

marble work received an additional cornice, and large spaces, where the mosaics had been picked out, were filled with plaster, and had the patterns completed by painting. A new inscription was painted around the frieze signed by the Abbot's monogram. Remnants of plaster filling are found on the mosaic tombs of Henry III and of Katherine. Several of the Royal tombs around the Confessor's shrine received new painted inscriptions which have recently been more clearly revealed by cleaning. The often-quoted words PACTUM SERVA on the tomb of Edward I, belong to this work. These inscriptions are in a good form of Roman letter (Fig. 25). The old sculptured coats of arms in the choir aisles were now repainted and inscriptions written over them in "Lombardic" characters. The continuation of the heraldry to the west end seems now to have been done

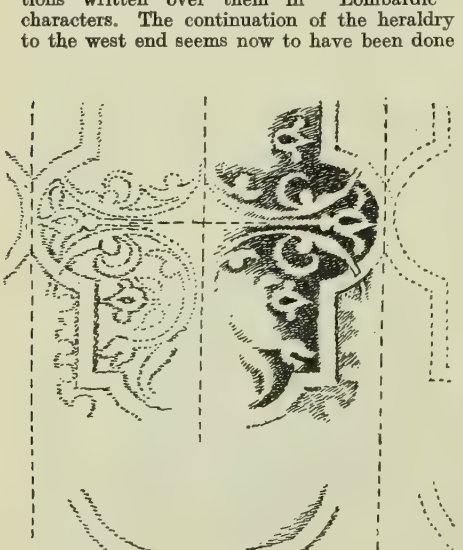

FIG. 26.

for the first time. The recess where the tomb of Katherine is also appears to have been painted at this time. Recently a fragment of wall-painting of Holbeinesque style, and very pretty, has been discovered in one of the Canon's houses (Fig. 26).

CAMBERWELL SCHOOL OF ARTS AND CRAFTS

ANNUAL EXHIBITION.

THE exhibition of work by students of this school, which closed last week, well repaid a visit from those who wished to acquaint themselves with the methods and direction of such teaching. For the doubts which some have felt as to the adequacy of this collective instruction in schools as an alternative to the old apprenticeship system, and that it would be lacking in practical character, would have been a good deal resolved by a visit. We have, in fact, to recognise the school method as definitely replacing the old one. Government schools of art have been subjected to some criticism, not always unjustly, and they no doubt differ in character, but under enlightened direction, such as guides the work in this school, it is difficult to sustain objection. Results go to show that the training is very practically conducted and likely to have a very healthy effect on the conduct of industry. Mr. Thorogood, who is in charge of the Camberwell schools, is himself an accomplished potter and brings an experience sufficiently associated with existing industrial methods to approach the matter in entirely practical ways, realising that we must work through a knowledge of present conditions and not in too detached and abstract a manner. We shall not achieve much by wholesale rejection of industrial methods; rather, with a larger apprehension of its needs and working through them and with them to better results, we shall do much more.

What, then, is the influence which such a school is bringing to bear on industry and the crafts? It appears to us that it must penetrate industry with more efficiency as the pupils trained in a better appreciation are absorbed into it. It is bound to do so if it has something better to offer. We are not inclined to believe that there is any unreasonable resistance to be found in industry itself, and the manufacturer who is sometimes misjudged, is not unwilling to be helped, when it is considered mutually. But this is not all: the better understanding of materials and the best use to be made of them, the fitness of design to purpose, combined with the freedom allowed to the student to develop his own nature, is fitting the best of them to work independently. Students who have been trained in this school have established their own independent practice in one or other of the crafts, such as pottery or bookbinding, forming on a small scale their own industry, and are assisting to spread local industries throughout the country. This is almost of national importance when the revival of village life and the decentralisation of industry is so desirable.

We were much interested, as showing the intimate nature and intelligence guiding the instruction, to learn that the student of pottery is encouraged, where available, to bring samples of clay or other material from the locality in which he lives that experiments may be made with it. We understand that one old student is at the present time carrying on successfully a pottery in a country district on the experience gained in this way of the local material when experimented with in the schools.

The exhibition was representative of the different classes and varying ages of the students, and it was surprising to notice the efficiency of the results even in one term of work. In the class devoted to costume making, some of the drawings were clever and graceful, though others showed their skilfulness in less agreeable ways. An announcement told us of work devoted to "commercial design, stained glass work, &c.," but it should be remembered that there is only design, and that rightly informed it is all of one nature, otherwise we are in danger of arbitrary distinctions, such as that which would differentiate "ecclesiastical" art from other art. Examples of embroidery shown were not very successful in colour. A very attractive part of the exhibition was that devoted to nature studies; examples of flower, leaf and seed cases were exhibited, very creditable to the students. In the second year Junior Art Course studies of bird life were equally commendable. In thinki the usefulness of such studies, it will have noticed how often the best work done in po is seen where the design and form are fou on the direct inspiration of nature, so notic in the most successful pottery executed b Martin Brothers. The value of such n study is that is intervenes to prevent the st from absorbing too early merely derivativ more standardised ways of ornament, impoverishes so much of the work done.

It is almost invidious to call attentic particular examples, when the general lev the work was so praiseworthy. But in the J Art Course for plaster work the little figu a girl with instrument, by B. Hodgkinson all the freedom and ingenuousness tha associate with Gothic work. That this should be preserved through the further stag the training so that it reaches the building u paired must be the desire of all who have to see how difficult it is to preserve a spi unsophisticated and natural. In this schoo craft practise is so thorough that in the po classes the students mix their own glazes study the properties of materials, beco acquainted with every stage of the craft; does this need a very lengthened trainin acquire. We were interested to hear this emphasised by the Principal, because putting the emphasis in the right place. exaggeration of view has gone to the subje craft training, in which really there is very mystery. The mystery is in the art. W train craftsmen pretty quickly, and these sc are doing so, but we cannot make artists the artist knows that the exaggeration o difficulties of the former obscures the real i suggesting that to be the end which is onl means. The arts only permeate life and fi when that is sound and pure. Craftsmans the threshold not the goal. The problem v be a relatively small one were we only conc with the latter, though it is most satisfacto see that the training in craftsmanship is on r lines, as at this school. The darkness is l from this era of industrialism and there is r to believe that we have left the worst behind.

COLOUR IN ITALIAN ARCHITECTURE

IN a recent lecture at the Central S of Arts and Crafts, Sir Banister Fle F.R.I.B.A., continued the study of C architecture in Italy, this time in the c and southern parts of that country. The C spirit, he said, did not appeal to these sou artists, who retained the rectangular eff classic architecture, and indulged in l splashes of colour in the façades, obt by the use of brightly-contrasted ma In Rome, basilican churches were suff and S. Maria sopra Minerva was the only church in the Eternal City. In Florence, o ever, a new monument arose in the Cat dedicated to S. Maria del Fiere, with its s and beautiful Giotto's Lily Tower, belov all great writers on art, and its baptistr its bronze gates—all vividly shown by t of lantern slides. More purely Romanes tradition was the austere pile of S. Frances a its monastic buildings at Assisi, built b friars on the death of the noble S. Fr their founder, the greatest and yet the hu son of that Italian town. This pile formed the most monumental monastic groups in and an outward sign of a devoted life.

Wellingborough School Memorial.

The Bishop of Peterborough visited W borough School recently to dedicate th memorial. The memorial, erected by pa present Wellinburians, has been design Mr. Talbot Brown, of Wellingborough a carried out by local craftsmen. The me is completed by an east window, depicti Michael, St. George, St. Joan of Arc, St. of Tours, and St. Alban, the work of Mr. Eden.

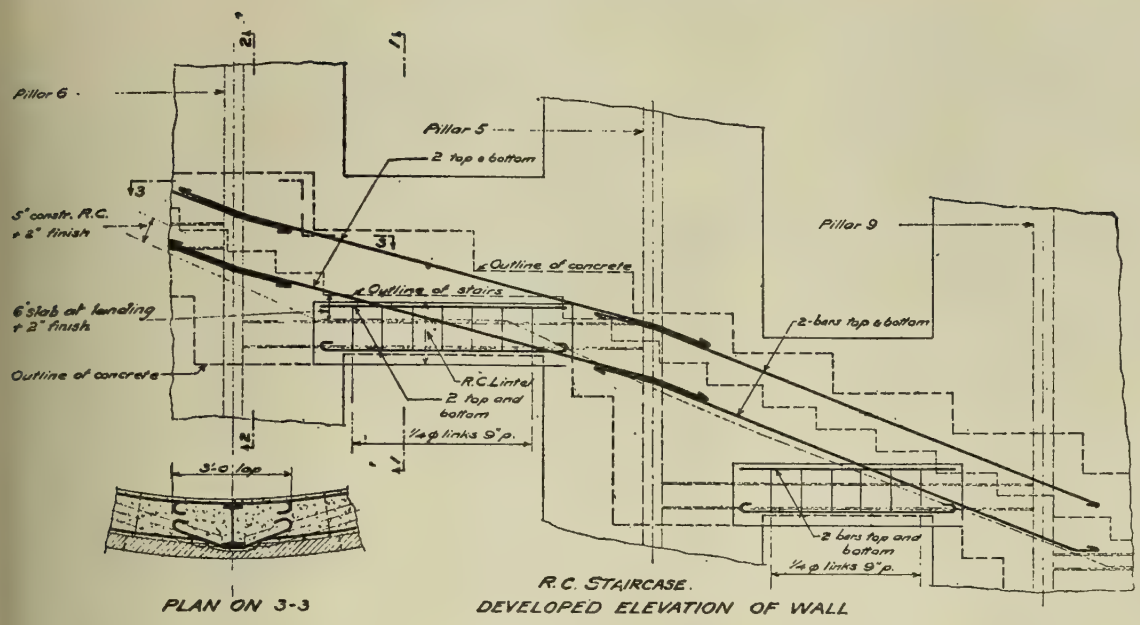

FIG. 4.

MODELLING OF ST. ES' PARK STATION

remodelling of St. James' Park with a block of offices over to form sion of the present offices, presented teresting problems to the architects, , and builders employed on the work. t procedure was the making of an survey in order to set out the steel ilding, which had to follow the curve racks.

emoval of the station roof and the of eighteen 20-ton girders of 53 ft. carry the new building over the station was the first problem to be d. No interference with the traffic wed, and platforms of not less than ld also to be kept clear. The plat- ere of hollow construction, and it ld necessary to cut holes through to rete below and to insert short lengths 12 baulk timbers to finish ½ in. above form level. These short lengths the cill of a very strong braced he full length of the station, the the gantry being kept some 6 in. e lever of the new girders. Across le width of the station rolled steel × 7½ were placed about 8 ft. aring on the wood gantry at each hese girders were erected in two y a crane working on the railway. deck of 3-in. timber covered in the the station, and over the platforms ted iron roof was placed under this protect passengers. Arrangements be made to preserve this iron roof completion of the building. This arrangement enabled the existing e taken down, oxy-acetylene being ut it down in sections.

After the old roof and parapet had been taken away the top of the brick piers were cut away and a reinforced concrete pad 3 ft. thick was constructed in one piece over the brick piers and the reinforced concrete enclosure, spreading the load from the main steel girder to the brick core as well as the reinforced concrete strengthening. This was done by a novel method of reinforced concrete enclosure to the piers, extending down to the footers and spread in the form of an inverted mushroom to obtain the necessary foundation area, both to support the new building and to take the earth pressure. This concrete enclosure covered three sides of the brick pier in the shape of a " U " on plan, and the bars of the " U " were secured by steel rods with three holes through the brick pier (see Fig. 1). Tests were carried out on the old bricks forming the retaining wall and the results obtained were interesting in that the perforated brick showed a higher crushing strain than the ordinary stocks.

Access to the building site was only obtained by a gap 5 ft. wide between two buildings, the girders being 4 ft. 6 in. deep.

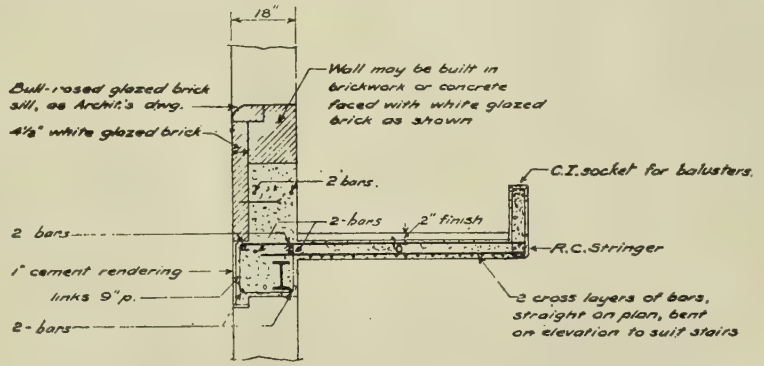

FIG. 5.

The method of placing these big girders in position was to place railway metals on top of the 24 × 7½ R.S.J. and directly over the gantry below, small trucks being used to carry the girders, and hand-winches with steel rope and pulley dragged the girders to their positions without placing any lifting pole or crane in the station; hydraulic jacks were used to up-end the girders on reaching their positions, packing pieces being

By the steel could be manufactured iers were constructed, and before d be set out on the site for the nd some three months' time was d in the time of construction of acture, and particularly the manu- e main girders.

ing of the new building so as with the existing block of offices and with a small block of offices er-street end, also presented some nd exact levels were essential. lliptical staircase forms the junction between the old and new buildings, and accommodates the varying levels, as well as presenting a symmetrical appearance from the entrance hall.

Fig. 3 shows a typical framing plan of the upper floors and Figs. 4 and 5 show the special design of the elliptical staircase, the steps and landings being carried on the cantilever principle from the external walls, which are also elliptical. This stair provides a flowing soffit. The stringers stiffen the construction, but are not required to act as beams.

For lightness, hollow tile floors, with rods, were selected, the work being carried out by Messrs. Diespeker & Co., Limited. A concrete mixer with tower elevator on the American principle was used on an adjoining site, and the concrete fed by means of shutes on to site, the one disadvantage in the use of this feed being that the concrete delivered over a long distance became rather uneven in quality, and eventually this was abandoned and the concrete was taken in skips on rails to destination.

The lifts were installed by Messrs. Waygood-Otis, and are directly over the railway station. A heavy rolled steel joist bottom to the lift pit was constructed, bearing on the bottom flanges of the 4 ft. 6 in. girders; various safety devices were gone into as a precaution against the lifts breaking through into the station below, but the only additional precaution taken was to put safety gear to the balance weights.

Lift fronts were carried out by Messrs. Caston. The heating was carried out by Messrs Rosser & Russell. A new boiler-house has been built and equipped to heat the old and new buildings in the basement, access being obtained from the platform, the long horizontal runs necessitating the use of pumps to maintain efficient circulation. The tiles were supplied and fixed by Messrs. Van Straaten.

The entrance hall was enlarged by the removal of the old lift staircase, and has been panelled in English oak to form a war memorial to those men belonging to the railway company who lost their lives in the war. Some 1,400 names are inscribed on the oak panels. The panelling and marble work were carried out from the architects' designs by Messrs. Roberson, of Knightsbridge. The architects were Messrs. Richardson & Gill; consulting engineer, Mr. S. B. Bylander; contractors, Messrs. Huntington, Ltd.

Entrance to Offices, St. James' Park Station.

THE LONDON SOCIETY

On November 14 Dr. Septimus Sunderland lectured before the London Society on "The Spas of Old London and its Vicinity." The chairman, Mr. Carmichael Thomas, in introducing Dr. Sunderland, said he was a great authority on a subject which would appeal to every member of the London Society. Although their activities dealt with the future, it was desirable they should know something of Old London.

Dr. Sunderland, in the course of his remarks, said springs abounded not only on the north side of the river, but also in Southwark, Lambeth and contiguous neighbourhoods. As time went on, and as buildings were gradually erected over the outskirts of the old city, imperfect drainage and the construction of cesspools interfered with the purity of the springs and wells, many of which were gradually obliterated. The word "spa" was derived from a Walloon word, "espa," meaning "fountain," and took its origin from the town of Spa in Flanders, lying about sixteen miles south-west of Liege, very near the German frontier.

He would first call their attention to a little group of spas and spurious spas, to the number of eight, which existed in a small area, not one of them being more than a mile distant from the present King's Cross. These were: St. Chad's Well, King's Cross; Pancras Well, Bagnigge Well, Powis Spring (Great Ormond-street), and Islington Spa. The following he considered spurious: Sadler's Wells, Islington; London Spa; New Wells (Clerkenwell).

St. Chad's Well, in London, was situated opposite the present King's Cross. Pancras, or Pancridge Wells, flourished for a period of about 100 years from 1697, with intervals of comparative disuse, and were surrounded by a beautiful garden near the old church of St. Pancras. Bagnigge Wells were situated in Bagnigge Wells-road (now King's Cross-road), near the Fleet River. Islington Spa occupied part of the site of the present small public gardens (opened in 1895) known as Spa Green, Islington. Sadler's Wells (named from the man Sadler, who in the latter half of the seventeenth century established a music house in that part of Clerkenwell, afterwards for some time known as Sadler's Hollow, bounded on one side by the New River Head, near the present Rosebery-avenue), had some claim to have been a "Holy Well," used by the monks of St. John's Priory, Clerkenwell, before the Reformation. At anyrate, Sadler, digging in his garden, in 1683, came upon a flat stone covering a carved stone well of ancient date, which was found to contain a mild chalybeate water, and was considered to be the Holy Well referred to. He exploited this discovery and soon the public flocked in hundreds to imbibe the water with "capillaire" (a syrup flavoured with orange flower water), at 6d. the glass, or a guinea for a season's potations. Hampstead Spa enjoyed great popularity in the eighteenth century.

At Kilburn and Marylebone also there were spas and at Acton Wells, East Acton, about five miles from the Marble Arch, there was a spa fashionable during Queen Anne's reign. Several springs and wells, south of the Thames, near London, achieved a reputation in the eighteenth century, when there seemed to be a veritable craze for the foundation of spas. The first three he considered spurious—Bermondsey, Finch's Grotto Gardens, restoration of Spring Gardens—but St. George's Spa and Lambeth Wells were genuine. St. George's Spa, first mentioned in 1695, was situated about half a mile from Lambeth Wells in the grounds of the Dog and Duck Tavern, near some pools in the marshy lane of St. George's Fields. Lambeth Wells must be considered a genuine spa. Its two springs of mineral waters, situated in Three Coney-walk—now the crowded Lambeth-walk—near Lambeth Palace, were discovered late in the seventeenth century. A house was built over these wells and surmounted by a gilded ball. The usual amusements were inaugurated. The water was supplied to the neighbouring St. Thomas's Hospital and to other purchasers at a penny per quart, its chief use being for relief of affections of the liver and stomach. To the south of the river and more to the west, there were four spas whose waters had a great reputation, namely, Dulwich Wells, Sydenham Wells, Beulah Spa, and Streatham Spa. These were really country spas near London in the days when they flourished.

Beulah Spa, the last of the springs in the environs of London to be inaugurated as a spa, was the name given to the mineral spring at Upper Norwood, known to the residents of the surrounding districts in the latter part of the seventeenth century. Streatham Spa was one of the most important of the London spas. The existing Streatham Well is probably the only one of the medicinal springs of the environs of London where the water still remains uncontaminated and can be drunk with beneficial effect at the present day.

SOME ENGLISH CATHEDRALS AND STONE DECAY

Professor A. P. Laurie recently lectured to the students of the Royal Academy of Arts, Burlington House, on this subject. In the course of his remarks he said that for some years he had been making observations at the request of the Office of Works on the stone decay taking place in their ancient monuments. During this time he had collected a good deal of interesting information, and during the last summer he determined to visit some of their cathedrals with a view to collecting further facts. The cathedrals visited were Durham, Lincoln, Ely and Norwich, and in addition he re-examined the condition of the stone at Hampton Court and the Houses of Parliament, and paid a visit to Westminster Abbey.

Before speaking of these buildings he would refer to the ruins of Elgin Cathedral. In order to understand what was happening here and elsewhere it was necessary to classify the stones for building into three main groups:—The lime-stones, the sand-stones in which the quartz particles were united by calcite, and the sand-stones in which the particles were united by silica. This classification would be regarded by petrologists as wanting in detail and being somewhat diagrammatic in character, but it would be the most convenient for their present purpose, which was the injury caused to modern buildings by the presence of sulphur dioxide in the air produced by the burning of coal. The ordinary causes of stone decay did not require special mention, as they were well known to architects and builders; but the new and the main cause of the rapid decay taking place in modern buildings was the attack on the calcium carbonate of the lime-stone and of the calcite forming the binding material in sand-stones by sulphur dioxide in presence of air and moisture forming calcium sulphate. Calcium sulphate was slightly soluble in water, and therefore was being slowly dissolved in the rain and removed; but this was not the most serious cause of damage. Cases of rapid decay were found to be associated with the crystallisation of calcium sulphate inside the stone and the consequent breaking up of the stone. The lecturer showed micro-photographs of calcium sulphate crystals and magnesium sulphate crystals from Ely and from the Houses of Parliament respectively, and described experiments for producing the same effect in the laboratory.

Proceeding then to deal in detail with the stone decay taking place at Elgin, Durham, Lincoln and Ely, he directed the attention to the fact that in some cases where siliceous sand-stones had been used the source of lime must have been the mortar, the rain dissolving and washing the lime into the stone. He also showed from the analyses at remote places like Ely and Tintern Abbey that the destruction owing to sulphur dioxide was not the towns, but was spread over country districts. Finally he sta result of the evidence collected, th the best thing that could be done treat such stone surfaces with material depositing silica cement, a ally to wash down the building during the summer with a view t the excess of sulphate of lime diminish the danger of crystallisati it was not possible in the state of t knowledge to say whether such wa be safely applied to every variety of experiments in this direction were w in his opinion, of the serious consi architects.

THE DEVELOPMEN BUILT-UP AREA

Mr. William Haywood, F.R.I sixth town-planning lecture at University, on this subject, said the procedure usually adopted in resp provements in the built-up areas towns was so devised that negoti affected property and land might p as little interference as possible fr pulous action by speculators in la In those areas of boroughs which w built upon, however, this policy replaced by a procedure under t planning Acts, which protected the against such speculation; and it evident that built-up areas also brought within the Town-planning A given freedom in planning under the of a reasonable court of appeal against exploitation. Meanwhile, until thi similar protection was afforded, t the stimulating influence of public this most important and urgent pha planning activity; since scheme revision of their congested areas w far advanced towards adoption public was advised of them.

English methods differed mater American practice, which relied demand before official action was t where the bugbear of exploitation w before the adoption of a scheme, by of official approval, and was adju quently, by some form of better against benefited property, or by the of a legal tribunal. With respect to B the report of the "Housing Enq mittee," published in October, 19 mended that a plan for developing area of the city be put in hand im and the responsible City Departmen working at such a plan ever since; a the reason already given, their wo yet been made public.

In the comprehensive arterial r put forward by the Public Works and adopted by the city in 1917, th essential skeleton of their future with the exception of a small ce This area was shown on the map illu scheme, but was not included in for which special powers were the It was chiefly by the conditions in this centre that Birmingham, w 1,000,000 inhabitants, and a world- tation for municipal vigour, had h and found wanting in character. by the class of development in this the town that their capacity to ris indifferent provincialism in archit pression would be judged by future

"EFFICIENCY."

Brick Footings.

TO PROVINCIAL, NOVEMBER 14.]

our correspondent, "Provincial," can e that the District Surveyor will require ngs to all walls; if it were not so, the in Section 87, London Building Act, ld not have been inserted. Every have proper footings projecting as I did not always find it easy, but I it done.

HENRY LOVEGROVE.

e District Surveyor has no discre- wer under the L.B.A., and can only that Act as it stands. In modern London the section dealing with ngs is honoured more in the breach bservance, but in all cases the consent C.C. must first be obtained. The should be addressed to the Super- Architect of the L.C.C., at the County on foolscap paper. The section of the ned in the application must be stated, sons for which the application is made ounds under which the exception is reasonable. The application should anied by drawings on linen and in both of which will be retained. ld be no difficulty in obtaining con- case quoted by your corrrespondent.

"LONDONER."

Running Cost of Electric Lifts.

TO "STATISTIC," NOVEMBER 14.]

suming an average of 250 fully-loaded day, the probable running cost of a ion a travel of 50 ft. would be in the ood of £20 to £25 per year for current B.T.U., and to this must be added t attendant—say £100 per year—and amount almost negligible for the first , but an increasing amount with the ift.

"EXCELSIOR."

Thatching.

SIR,—I should be glad to be advised what is the best method of treating the eaves spouting in a thatched building. I believe in most old thatched cottages the rain-water was allowed to drip from the wide-spreading eaves, clear of the building, but now this will hardly do, although the ordinary rain-water casting is likely to look very thin and incongruous.

"OLD-FASHIONED."

Damp Walls.

SIR,—I would be pleased if you or any of your readers could suggest a remedy for damp house walls. The house faces east and the walls which are most troublesome form the corner near the fireplace in the front room on the ground floor. The damp wall is part of the frontage, *i.e.*, from the bay window to the wall of the adjoining house and also the inner wall which forms the partition wall between the two houses.

Under the room in question, there is an open cellar in which there are no signs of much dampness, and there is a constant ventilation through the gratings. I have tried removing the old plaster and having it replastered and coated with special dressings said to prevent dampness; however, within a few weeks the new paper was as wet as ever, and all its colouring destroyed. Any suggestion will be appreciated.

"HOUSEHOLDER."

Hollow Walls.

[REPLY TO "CAVITY," NOVEMBER 14.]

SIR,—The answer to the query by "Cavity" is probably that the wall was carelessly built, and that mortar droppings were allowed to lodge on the iron ties; the mortar thus acts as a bridge and conducts the moisture through the wall where the ties exist.

"MORTAR."

SIR,—The most probable solution to the mystery of the damp spots in the wall described by your correspondent is that the inner and outer shells of the wall being in courses of differing depth, some of the metal ties have been built in sloping slightly inwards, and so have conveyed the moisture from without, into the inner shell. It will be a difficult matter to cure, and some treatment whereby the inner face of the wall is sealed, or the outer face rendered, will have to be devised. The fact that there are entire rows of wall ties where the trouble has not occurred goes to confirm the above probable cause.

"LEVEL."

The Therm.

[REPLY TO "CONSUMER," NOVEMBER 14.]

SIR,—The therm is a unit of heating power. It is the equivalent of 100,000 B.T.U's (British Thermal Units), and one of the latter is the amount of heat required to increase the temperature of 1 lb. of water 1 deg. Fahr.

This new method of computing the charge for gas consumption is an overdue corollary to the introduction of incandescent mantels in the use of which the consumer is more concerned with the heating power of the gas which makes the mantel incandescent, than with the candle power of the raw gas flame. The amount of gas consumed to the therm will vary with the quality thereof, and this is determined and revised from time to time as a result of tests.

In any case the consumer has the advantage of knowing that he pays only for the work done, and that it is useless for the gas to ca' canny.

"MANTEL."

[The British Commercial Gas Co. inform us the "therm" system of charge was adopted by Parliament (in The Gas Regulation Act, 1920) on the initiative of the Board of Trade, acting on the recommendations of The Fuel Research Board. The "heat unit" in this country is known as the British Thermal Unit (= 1 B.Th.U.) This is the quantity of heat required to heat 1 lb. of water 1 deg. Fahr. A "therm" is the name for 100,000 B.Th.U.s. The "therm" system of charge provides that the quantity (*i.e.*, cubic feet) consumed, as measured and recorded by the meter, multiplied by the declared calorific value of the gas in B.Th.U's, shall be the basis of payment by the consumer. Assuming the calorific value declared by a company to be 500 B.Th.U.s, this means that each cubic foot of the gas supplied by that company will develop not less than 500 British Thermal Units when burned. A "thousand cubic feet," the old basis of charge, would therefore represent at least 1,000 × 500 = 500,000 heat units (B.Th.U.s). The new basis of charge, the "therm," is the name given to 100,000 heat units, so that 1,000 cubic feet would then be charged for as 5 therms. To convert "therms" into "cubic feet" in such a case all you need do is multiply the number of therms by 200.]

(Other replies on this subject have been received.)

SHEFFIELD SOCIETY OF ARCHITECTS & SURVEYORS

MR. E. W. B. SCOTT, A.R.I.B.A., lectured recently on "American Architecture as I Saw It," at Sheffield University. In the course of his remarks he said the position of architecture in America was a peculiarly interesting one. Perhaps for the first time in history they had a wealthy and highly complex civilisation in a new country almost without a past, but possessing and venerating the traditions of past ages in other lands. As a result they found them able and willing to build extensively, selecting the best from the traditions of Europe, while themselves unhampered by any archæological dead-hand. The American cities, like ours, were full of uninspired buildings of the last century; and they were pulled down ruthlessly to be replaced by better, while their cities were extending at a rate undreamed of over here.

The five weeks he spent in the States had not left on his mind the picture the late Mr. Bertram Goodhue drew at the R.I.B.A. when he described American architecture as undisciplined, aimless, chaotic and altogether inferior. His impression was rather that an art that knew most definitely what it was about; one that, making the fullest and frankest use of the work of other ages, was working out a manner in architecture which would interpret this complex civilisation. It seemed that sincerity and singleness of aim were teaching them to use the new materials and methods and to meet the new demands of this age better than was the case anywhere else.

In America vast wealth and opportunity had helped, so, undoubtedly, had the Beaux Arts; but it was the realising new conditions and the simple faith that they ought to be met in a rational manner that was their strength. Of course, this meant experiment; they were bound to cut new tracks in many directions in this pioneer work, and much work would be in the wrong direction. The man who never made a mistake never made anything. With reference to the work of Mr. Goodhue, he was, perhaps, best known for his Gothic churches, in which he had approached nearer to the spirit of the old mediæval builders, perhaps, than any man since the Renaissance, but he ventured to say, lovely as it was, that was not the work by which he would be longest remembered. He had another mood, a mood in which he broke away from tradition and reached forward into the future; disencumbering himself of Corinthian columns and Perpendicular windows, he attempted to get right down to the bones of architecture—to begin from the needs and requirements of the particular case and build, relying for his effect on almost stark simplicity and beauty of proportion. It was, therefore, future possibilities more than present achievements that he wished to look for in his views, and this applied not only to the public buildings but also to those which he went particularly to study—industrial buildings.

THE BUILDING TRADE

THE SHORTAGE OF SKILLED LABOUR

SOME NOTES BY "ESTIMATOR."

THE present shortage of skilled labour in the building industry is due to many reasons, the chief of which are:—(1) That numbers of men have gone into other occupations during the war and at other times and have evidently found their new sphere of work more congenial; (2) shortage of apprentices or learners.

To deal with the first point: As the men have left the industry, little can be done to bring them back to it, but care should be taken to remove any disadvantages under which the trade may unnecessarily suffer, and so stop further leakage. The wages paid in the building trade are at least as high as in most other industries, yet the sight of really skilled workmen going home in the evening all dirty and dusty would hardly attract recruits to the business in these showy times. Some simple form of convenience for washing, etc., should be provided on most works.

(2) Shortage of apprentices or learners.—The shortage of apprentices is popularly supposed to be due to the trade unions attempting to limit the number of apprentices admitted to the trade and the employers not taking sufficient numbers of apprentices. The trade unions do not want them and the employers do not take them. These obstructions will no doubt disappear in due course, and the progress of accepting apprentices may be hastened if some aspects of the case are considered.

The employer in the building trade finds that now the work in each trade is so carefully defined, the number of men he employs varies considerably, and if he engaged sufficient apprentices to suit his boom times he would, as soon as the various parts of the job were brought to completion, have no work for these youths. This might be overcome by some system of passing on the apprentice to other employers during a slack time, although there are many objections to such a course, as the divided authority and control of the apprentice would affect the discipline and training of the youth. Many of the objections of employers to apprentices are due to the conduct of the apprentices themselves, so much so that employers do not want to be bothered with them. In the case of boys leaving an elementary school and going direct to, say, a joiner's shop, they can only be given very elementary processes to do, and probably fill in their time making glue, or similar jobs, so that the course of training seems monotonous. The monotony of the training and the natural hostility to control sometimes leads the boy to kick over the traces, to the annoyance of the foreman or employer. The foreman objects to the boy and the boy objects to the foreman. Both youth and employer grow ill weeds. It is in the early years of the apprenticeship period that so many failures occur. This may be obviated by the trades concerned insisting on the proposed apprentice taking a two or three years' course of manual training in the workshop of one of the schools of building, which would ensure the lad having been under control during some of the susceptible years, and being well grounded in the elementary parts of the work and ready to use the tools, and fit to receive and benefit by any opportunity of working in his trade.

The other type of learner is one who drifts into the trade as an errand boy or general assistant, and takes every opportunity of using the tools and learning the trade, and many of our best craftsmen develop in this way. Such a boy must be civil, diligent and obliging, and on good terms with everyone, so as to get opportunities of advancement as they occur. The latter considerations, unfortunately, sometimes do not appeal to apprentices.

The weakness of the present phase of the apprenticeship question is that immediately the lad has "served his time" and is reinforced by a trade-union ticket, he may ask the full standard rate of pay and get it, at any rate in boom times.

It is not good for the industry for youths, immediately they have passed through some period of training, to be allowed to pass as full-blown mechanics, and secure the same rate of pay as an expert craftsman. Both employers and trade unionists should arrange some system of grading by which wages should be paid in accordance with the degree of skill exhibited, and it is only by some such agreement that it will be worth a man's while to become a highly skilled tradesman to equal the craftsmen of previous generations.

Will the present "workers' paradise" long continue?

BUILDERS' BENEVOLENT INSTITUTION

Annual Dinner.

THE seventy-second annual dinner of the Builders' Benevolent Institution was held on November 13, at the Hotel Victoria, the President, Mr. G. Perry Nash, F.I.O.B., presiding over a large gathering, amongst whom were Messrs. R. F. Foster, F.R.I.B.A., C. Dunch, M.S.A., F. M. May, F.I.O.B., J. W. Chessum, J.P., B.B.I., Major R. J. Holliday, M.C., F.I.O.B., B.B.I., J. M. Theobald, F.S.I., H. T. Holloway, F.I.O.B., P. L.M.B.A., T. S. Darbyshire, A.R.I.B.A., H. Tanner, F.R.I.B.A., W. Woodward, F.R.I.B.A., J. E. Drower, C.B.E., H. D. Searles-Wood, F.R.I.B.A., H. Austen Hall, F.R.I.B.A., F. Wheeler, F.R.I.B.A., F. Higgs, F.I.O.B., P.P. B.B.I., R. B. Brown, F.S.I., Dudley Bartlett, F.I.O.B., C. C. Trollope, F. G. Minter, F.I.O.B., S. G. Nash, A.I.O.B., W. Aumonier, Major Harold Bailey, F.R.I.B.A., F. W. Stratton, F.I.O.B., E. J. Reed, F.S.I., Guy Church, F.R.I.B.A., G. Grey Wornum, F.R.I.B.A., John T. Bolding, Major Troup, A. B. Falkner, F.I.O.B., R. H. Hellyer, A. H. Adamson, F.I.O.B., Andrew Mather, M.S.A., Thomas Thorne, F.I.O.B., L. Withrington, A.I.O.B., L. L. Withrington, A.M.I.E., G. S. Roberts, F.I.O.B., G. H. Parker, F.I.O.B., A. Smithers, F.R.I.B.A., J. J. Clark, A.R.I.B.A., Capt. Frank R. Shurmur, and Fred Thorne, J.P., F.I.O.B.

After the usual loyal toasts had been honoured, Mr. H. T. Holloway, in proposing the "Builders' Benevolent Institution and its President," said grave risks were attached to the building calling. A large number of their members fell on bad times, and it was to relieve their distresses that the Institution existed. It had now been established 72 years, and it was run mainly by a self-sacrificing committee who sat once a month at 48, Bedford-square. With reference to the recent strike Mr. Holloway said after seven weeks bitter struggle without precedent, they had, he thought, fixed up a peace which was not only eminently satisfactory, but would, he thought, be honoured by both sides. He hoped that wages were firmly stabilised until January, 1926, and he would suggest that the workmen were satisfied with the increase in London, and were settling down to work with a will. They were pleased with the way they had been treated. There was still grave trouble, however, the gravest being the shortage of skilled men, and that the employers hoped to tackle, and were tackling now. They hoped to get co-operation from the Trade Unions. Considerable modification had been made with regard to apprentices and he hoped the builders would take it seriously to heart. If the builders would only take on suitable candidates the industry would get rid of the throttle hold. A happy featu of them seemed to be what looked i of work ahead.

The President, in responding, regard to the activities of the I he would draw their attention good work which had been carrie over seventy years. Assistance rendered to hundreds of homes d period; they were carrying on with energy and usefulness. He would re that the object of the Institution w temporary relief and grant pensions sitous masters and their widows where They had forty-six pensioners, and i had been able to grant a gift of £5 at and Midsummer to each pensioner. I past year the committee had decided the scope of the Institution. At their ing it was decided to include master b and plasterers. It was, therefore, very they should secure increased suppor

Major R. J. Holliday, in proposing th tects and Surveyors," said he was conv it was fully realised that architecture greatest of the arts. It was the resp of architects to guide public taste, to many problems which occurred, and to r high standard of dignity. No other had a higher standard of integrity mercial honour than the architectura veying professions. A high standard was demanded from them, and the r which the profession carried out its d generally appreciated. Had they fully ated, however, the difference betwee of architecture and the other arts? Ma worked in the seclusion of the studi dissatisfied could destroy their work. so with the architect, however. Fi would urge a closer friendship bet architect and surveyor and the ger tractor.

Mr. Henry Tanner, in responding there was one subject on which the agree it was the subject of the B Institution. Major Holliday had asked co-operation between the architect, veyor, and the contractor. He would however, that the architect always tr his best for the contractor. They all put up good buildings and to get credit clients and the world in general. Th had to put up the building for the and on behalf of the architects he them.

Mr. J. E. Drower also responded and appreciated the troubles of the buil tractor. There seemed a continual labour, and the building contractor's li long struggle against circumstances. always the millstone of labour tro would suggest that the Builders' B Institution was the "Good Red Cros bound up the wounds of those who f way.

Mr. A. H. Adamson, in proposing th "The Vice-Presidents, Trustees, Comr Stewards, coupled with Mr. John T. said they had to thank the Vice-Pres putting the finances of the Institut sound basis. Little work would be g trustees if they responded to the prese The Institution was run on econom and a visit was made to the hom applicant. The builder's lot was a and they greatly appreciated the help the architects and surveyors. He w special tribute to Mr. J. T. Bolding, been connected with the Institution fo years. If they all worked together fo of the building industry, which was most important in the country, it wo the good of the industry as a whole. A the problem of the shortage of labour, the question of the importation material—bricks, tiles, slates, &c.

r. T. Bolding, in responding, said the Presidents were the main feature of the tion. They had no idea, however, of uble which was taken by the trustees, f ey attended one of their monthly meet- thly would be surprised.

e resident then announced that the total n which had been collected amounted ,6 19s. 6d.

arter, in proposing "The Visitors," Institution could not go on if it were not ce who came year after year. Mr. J. M. bd responded, congratulating the Insti- n the result of the appeal.

EIFIC PERFORMANCE

Preliminary Contract.

the days of house shortage the would-be a house often finds himself in some d; having found a house which he ay suit him he is anxious to close the immediately, but caution tells him not m himself definitely on a preliminary tin and without further inquiries, and as ul the preliminary contract, whether l informal, is rarely a definite contract ic specific performance will be decreed.

ent case—Lockett *v.* Norman-Wright—s n example of this difficulty, although s istance it was the buyer who broke ne tiations. The plaintiff was the c three floors in a house in Park- ad in two interviews with the defend- e ad expressed willingness to let the al fourth floors to the latter for a f ght years at a rent of £300 per annum, aintiff to execute certain alterations and . On February 26, 1924, the defendant, h telephone, told the plaintiff that he tee the flat and on the following day the ff received a letter from the defendant irming my conversation over the tele- ts afternoon, subject to suitable agree- bing arranged between your solicitor and an subject to your carrying out the tio s of the top flat at your house in Park- . I am prepared to take the flat for d f eight years at an inclusive rent of enannum, including all rates and taxes, . My solicitor is ——, with whom I bglad if your solicitors would communi- gding the agreement." On the same o tter was received the plaintiff acknow- itsaying he had sent it to his solicitors ws applying for permission to make the r alterations.

atter was taken up by the parties' rand on March 31 a draft lease had grd between them the term to begin om March 25. To this draft the f solicitors had appended a note that praises were not ready for occupation e l March 25, the landlord would hand letr stating that the rent was not to run he were so ready, and the defendant's rs ad noted they observed the note and o course, agreed that the alterations d ust be carried out to the tenant's bl satisfaction." On April 11 the ntefused to go on with the transaction. se only reported at present shortly and uns for this refusal are not stated, but int brought the action for specific per- e asing his claim (1) on an agreement ate by verbal message on the telephone dendant's letter of the same date, and nalely an agreement by the defendant olitor constituted by the said letter of y 6, the correspondence between the rs, nd the approved draft lease with the ieion.

Cout held, on the authority of Rossdale y 021, 1 Ch. 57; *The Builder*, Novem- 19), Coope *v.* Ridout (1921, Ch. 291), illigworth *v.* Esche (1924, 1 Ch. 97; *ild*, December 28, 1923), that there was ncon between the expression used in tenant's letter, "subject to suitable ent being arranged between your solicitors and mine," and the expressions used in those cases, "subject to formal contract," "subject to contract," and "subject to a proper contract to be prepared by the vendor's solicitor," and thus on that head the claim failed, for it has been held there is no enforceable contract where the execution of a further contract is stipulated for, as the law does not recognise a contract to enter into a contract, and on the alternative claim the Court held that there was no evidence that the defendant's solicitors were authorised to enter into a contract on his behalf or that such authority could be implied in the circumstances of this case. On the first point, perhaps one of the strongest cases is Coope *v.* Ridout, where the original offer was made "subject to title and contract," and where the Court came to the conclusion that assuming in the plaintiff's favour that all the terms founded on the correspondence and interviews had been settled on those interviews and letters, one by one, and all those terms had been embodied in the draft, one condition had still to be fulfilled, that it should take the form of a contract made *inter partes* and formally executed. This judgment received the approval of the Court of Appeal. Where, therefore, reference is made to a future document it seems useless to apply for an order decreeing specific performance.

On the second point, however, the case seems a hard one, as the defendant in his letter had accepted the flat "subject to suitable agreements being arranged by your solicitors and mine," and the draft represented such an agreement. Yet authority was held lacking in the solicitors to contract for the defendant. The law laid down in the cases illustrates the difficulties purchasers and vendors are placed in in coming to a binding agreement on which specific performance will be granted in the early stages of the transaction, for houses cannot be purchased like some other articles on a mere inspection, but other inquiries are essential; yet, when a purchase is arranged it would certainly appear that the law should compel a completion of the bargain when either party rides off on some reason not one of the matters left open by the preliminary contract for investigation. Damages, even if they can be obtained, for breach of the contract in many, if not most cases, would not afford any real remedy. It is extremely difficult to obtain any alteration in the law relating to real property, but this question of specific performance appears by the decided cases to have been narrowed down unnecessarily and to leave either party to a purchase too long at the mercy of the other party.

Part Performance.

A case, Rawlinson *v.* Ames (*Weekly Notes*, November 15), deals with another aspect of the law on this subject and should be noted in conjunction with the case we have referred to above. In this case the defendant had entered into a verbal agreement with the plaintiff to take the lease of a flat, and as in the other case it was agreed that certain alterations were to be made in the flat, presumably by the plaintiff, but the report, which at present is only in the form of a headnote, does not specifically state that fact. During the progress of the alterations the defendant frequently visited the flat and made suggestions for further alterations which were carried out by the plaintiff at her request. The defendant subsequently repudiated the contract and the plaintiff brought this action for specific performance of the verbal agreement and the question to be decided was whether the defendant could rely upon the Statute of Frauds as a defence to the action, or whether there had been sufficient acts of part performance to take the case out of the Statute.

In order that an Act may have the effect of part performance and take a case out of the Statute, which requires a memorandum or note in writing signed by the party to be charged, the Act or Acts relied upon must unequivocally refer to the parol agreement.

The Court held that the acts of the plaintiff were referable only to such an agreement as was alleged in this case, and on the authority of Dickinson *v.* Barrow (2904, Ch. 339), the plaintiff was entitled to a decree for specific performance. That case, the effect of which the Court said was correctly expressed in the headnote in the Law Reports, closely resembled the present case. There the defendant had entered into a verbal contract for the purchase of a site from the plaintiffs, who were to erect a house upon it. During the progress of the building she had frequently visited the site and made suggestions for material alterations and improvements in the building, which were carried out by the plaintiffs at her request. Subsequently, she had repudiated the contract and the plaintiffs had brought an action for specific performance, and the headnote, which the learned Judge approved, runs, "Held, that the acts done by the plaintiffs at the request of the defendant were acts of part performance taking the case out of the Statute of Frauds and that the plaintiffs were entitled to judgment for specific performance."

RENT INCREASED FOR REPAIRS

A CASE of some interest to property owners is Biddle *v.* Morris (1924 2 K.B. 490). The appellant was the owner of a dwelling house in Birmingham the annual value of which on the revaluation for the year ending April 5, 1924, was for the purposes of Schedule A £21 gross and £15 15s. net, during the year ending April 5, 1923. The premises were let on a weekly tenancy of 8s. 5d., which was made up as follows: 6s. net rent, 10¾d. the increase of 15 per cent. permitted under section 2 subsection (1) (*c*) of the Rent Act, 1920, and 1s. 6d. the increase of 25 per cent. allowed for repairs where the landlord is liable for the whole of the repairs under section 2 subsection (1) (*d*). Before 1923 the premises were assessed to income tax at £15 gross and £12 10s. net. The appellant contended that the gross annual value for the purposes of Schedule A was the net rent plus the 15 per cent. increase allowed under paragraph (*c*) of the Rent Act, but that the increase of 25 per cent. under paragraph (*d*) was no part of the annual value but a mere indemnity given to the landlord in respect of the increased cost of repairs.

The Court negatived this contention, holding that the 25 per cent. increase must be treated as part of the rent, as the landlord received the full amount even if he does not require to spend it on repairs. The Court said this increase was not an indemnity against the landlord's liability for repairs, but an increase in rent which he was allowed to make because, being under a covenant to repair, he must be allowed to exercise more freedom than is permitted under the Rent Act.

The Court, however, conceded that on the figures it might be hard upon the landlord that although the statutory increase allowed was 25 per cent. he was only allowed to deduct one quarter of that amount for taxation.

It is hard on the conscientious landlord as it is common knowledge that the 25 per cent. does not cover the cost of repairs at present prices, or even nearly so, and the Court admitted that even if the 25 per cent. represented the actual cost of the repairs the figures worked out hardly for the landlord, but said that if that were the case it was because the statutory allowance was not fixed high enough.

New Brighton's Promenade.

Wallasey Council has approved the draft of the Bill embodying the £750,000 scheme for the extension of the New Brighton promenade to a point on the Leasowe side of Harrison-drive, and it is hoped that it may be promoted in the next session of Parliament, and that the work will be begun in the spring of 1926. Seven years, it is stated, will be occupied in carrying out the improvement. The scheme provides for space for the erection in the Harrison-drive area, facing seawards, of private residences, boarding-houses, and an hotel or hotels.

NEW BUILDINGS IN LONDON.

Whitcombe-street.—NEW PREMISES.—Messrs. The Morris Westminster Guild, Morris House, Rochester-row, inform us that they were responsible for carrying out the metal windows for the Automobile Association, Ltd., and not as stated in our last issue.

Harrow.—The Governors of Harrow School have decided to put in hand the decoration of Harrow School Speech Room, which has been incomplete for many years. The internal decoration will be carried out mainly from a grant made by the trustees of the late Mr. J. G. Apear, and a scheme has been prepared by Sir Charles Nicholson, of New-square, Lincoln's Inn, London, W.C.2, and accepted. Outside a small building is being erected to contain a cinema apparatus for lecture purposes. In due course, if funds permit, it is proposed to complete the speech room by the addition of the tower, for which plans also have been prepared by Sir C. Nicholson.

Victoria-street.—A new block of offices are to be erected at the corner of Victoria-street and Allington-street, S.W. 1, covering a ground floor area of about 7,000 square feet. The building will be of six floors, equipped with a lift, heating on the low-pressure hot-water system, electric lighting, telephones, &c., and will be divided up into suites of offices according to the requirements of tenants. Accommodation will be provided for in the basement for strong rooms, stores, heating chamber, &c. The site has two street frontages of 60 ft. and 100 ft. respectively. A bank will occupy the corner site. The building will be erected on a steel frame with an elevation in brick and Portland stone. The floors will be of fireproof materials. The architect is Mr. J. Stanley Beard, M.S.A., of 52, Baker-street, London, W. 1. The demolition contractors are Messrs. F. Keen & Son, 469, Old Kent-road, London, S.E.

Royal Albert Docks.—Operations on the foundations for a new warehouse for the storage of tobacco at the Port of London Authority's Royal Albert Docks, E., are now in hand. The new bonded warehouse is to replace one destroyed by fire about twelve months ago. It will be of the single-story type and will have a storage capacity of 3,000 tons. The foundations are to be of concrete. The walls will be of brick and the roof will be supported on steel trusses, the total weight of steel being about 150 tons. The interior equipment will include overhead cranes and a heating and ventilating plant. The general contractors are Messrs. John Mowlem & Co., Ltd., Ebury Bridge-road, London, S.W. 1. Plans have been prepared by the Authority's engineering staff at Tower-hill, E.C. 3, under the direction of Sir Cyril Kirkpatrick, chief engineer.

Pentonville-road.—A large motor omnibus garage is being erected in Pentonville-road on a site adjoining Cleveland-square. The area to be covered has a frontage to Pentonville-road of 144 ft., and will be in plan in the form of a reversed "L," with the base running along the Pentonville-road. The main building will extend back parallel with Cleveland-square for 256 ft., and will be about 75 ft. wide. Steel frame and brick construction is being employed. The walls will be filled in with red brick with panels of stock bricks and a stone coping. Extensive glazing will also be used, a long row of metal casements being used. The floor will be of concrete. The steel work for the ground floor will be built up of three rows of stanchions spaced at 38 ft. centres, resting on a steel and concrete grillage. The height to the first floor will be 15 ft. The framework for the first floor and roof will be of 8 in. by 5 in. stanchions up to the eaves, 30 ft. above the ground. The roof will be supported by two rows of triangular principals, each of 37 ft. span. The outer covering will be of slates and asbestos-cement tiles, with a central glazed portion in the centre of each span. The floors will be of mass concrete. The Pentonville-road elevation will be in the form of a curve, which will be used as a run-in and for the installation of petrol pumps. The southern wing of the building will be devoted to the runway up to the first floor, stores, offices, lavatory accommodation, &c. The roof, in this case, will be flat, and fireproof doors will divide each building. The contractors are Messrs. Levy & Lester, of 32, York-road, King's Cross, London, N.1. The steelwork is being supplied and erected by Messrs. Measures Bros. (1922), Ltd., 105, Southwark-street, S.E.1; the metal casements by Messrs. Williams & Williams, of Sardinia House, Kingsway, W.C.2; and the tiles by Messrs. Turner Brothers Asbestos Co., Ltd., Rochdale. The architect is Mr. A. H. Lester, of 32, North-road, London, N.1.

Kensington.—The Council of the Royal Albert Hall, at Kensington, S.W., are appealing for funds to enable structural alterations to the hall to be carried out in conformity to the regulations of the London County Council. The work will include new decorations and heating and electric lighting improvements. The organ is also to be entirely reconstructed, the contract for this having been placed with Messrs. Harrison & Harrison, of Durham. The architect to the Albert Hall Council is Mr. R. Langton Cole, F.R.I.B.A., of 23, Throgmorton-street, London, E.C. 2.

Regent-street.—New premises are being built on the site of Nos. 92-94, Regent-street, W. 1, for Messrs. H. L. Brown & Sons, jewellers and diamond merchants, of London and Sheffield. The building is of seven stories and basements, and will be built on a steel frame with an outer façade of Portland stone. Green Cumberland slates will cover the Mansard roof. The builders are Messrs. Hall, Beddall & Co., Ltd., of Waterloo-road, London, S.E. 1. The architects are Messrs. Yates, Cook & Darbyshire, of 43, Great Marlborough-street, W. 1.

Cheapside.—An important site, covering Nos. 97-9, Cheapside, and 31-3, Lawrence-lane, E.C. 2, is to be developed on a building lease of 99 years. The new premises will have a frontage of 62 ft. to Cheapside, and 100 ft. to Lawrence-lane. The surveyors to the site, which has a total area of 5,238 ft., are Messrs. St. Quenton, Son & Stanley, of 34, Clement's-lane, London, E.C. 3.

Vauxhall.—A new office building is to be erected in Vauxhall Bridge-road, S.W. 1, with shops and showrooms on the ground floor. The new premises will consist of basement, ground, and three upper floors. They will be similar in design to the adjoining building, being carried out in brick, on a steel framework, with ornamental stone dressings. A Mansard roof of slates is to be provided. The floors will be of reinforced concrete. The window casements will be of steel. The general contractors are Messrs. Holliday & Greenwood, Ltd., of Stewart's-road, Battersea, London, S.W. 8. The architects are Messrs. Parnacott & Partners, of 93, York-road, Lambeth, S.E. 1.

Regent-street.—A large building of seven stories is being erected on the area at the junction of Regent-street and Glasshouse-street, W. 1, to the designs of Messrs. Yates, Cook & Darbyshire, of 43, Great Marlborough-street, W. 1. The premises are constructed on a heavy framework of steel, with extensive foundations, allowing for large basements. All the windows are of an ornamental cast-iron or steel type. The roof, of Mansard type, will be covered with Cumberland slates. The general contractors are Messrs. Thomas & Edge, of Station Chambers, Cross-street, Woolwich, S.E. 18, whilst the principal sub-contractors are as follows: Steel work, Messrs. Smith-Walker, Ltd., 33, Tothill-street, S.W. 1; Portland stone, Messrs. United Stone Firms, Ltd., 104A, Stewart's-road, Battersea, S.W. 8; fireproof floors, Messrs. F. Bradford & Co., 23, Coopersale-road, E. 9; asphalte, Messrs. Ragusa Asphalte Co., Ltd., 25, Oxford-street, W. 1; lifts, Messrs. Marryat & Scott, Ltd., 57A, Hatton-gardens, E.C. 1; casements, Messrs. A. Wootton & Son, 62, Chiswell-street, E.C. 1; pavement lights, Messrs. Geo. Wright (London), Ltd., 19, Newman street, W. 1; and sanitary fittings, Messrs. A. Goslett & Sons, Ltd., 27, Charing Cross-road, London, W.C. 2.

Wandsworth.—Large additions are made to the buildings of the Boling Hospital, at Wandsworth Common, S.W. The new extensions will principally cons new ear and throat departments, new n home, and the enlargement and alterati the present buildings. The new building vary in height from two to three stories. buildings will be erected in brick with dressings. Fire-proof floors will be introd finished off with patent surfacing. Heatin electric lighting systems will be ins The roofs will be flat, of concrete, wit asphalted covering. The general contracto Messrs. John Garrett & Son, of 83, Ba hill, Wandsworth, S.W. 12. The architec Messrs. Young & Hall, of 17, Southam street, London, W.C. 1.

Cheapside.—A new retail branch stores be opened in Cheapside by Messrs. Austin Ltd., outfitters, as soon as the necessary tural alterations and shop fittings are comp The work involves alterations to the groun first floor, with the provision of an oak sta interior alterations in plaster, installati electric lighting and central heating, an fitting of shop equipment and showcases display windows, in light polished oak. contractors are Messrs. Harris & Sheldon, of Wood-street, London, E.C. 2, and Bir ham. The architects are Messrs. P. J. West & Emberton, of 7, Adam-street, St W.C.2.

Charing Cross-road.—Premises have acquired by the Express Dairy Co., o Tavistock-place, W.C. 1, in Charing C road, W.C. 1, for fitting up as a branch resta and café. Structural alterations and fittings and equipment, redecorations, are to be carried out to the designs o company's chief surveyor. The contract Mr. F. G. Minter, Ferry Works, Putney, Lo S.W. 15; and 10, Davies-street, London,

Greenwich-road.—Extensive additions are made to the Miller General Hospital for S East London, at Greenwich-road, S.E. The show a new ward block, giving accommod for an additional 78 beds. Four stori height, three floors will be devoted to v each having one ward of 24 beds and two s bed wards. The remainder of the buildin be used for kitchens, stores, &c., and for n accommodation, including a large dinin and lecture room. The building will be e in brick with stone and artificial stone dres The roof will be of concrete, asphalted and will be flat. A start is also to be ma a proposed nurses' hostel, and the first p to be put in hand will consist of a build five stories, providing 73 bedrooms, s rooms, reading and recreation rooms A lift will be installed in the ward block. architects are Messrs. W. A. Pite, Son & weather, of 12, Carteret-street, Westmi The quantity surveyor is Mr. W. J. Falkne of 12, Carteret-street.

Regent-street.—The old premises at 129-131, Regent-street, W. 1, are to be r fresh leases having been granted by His Ma Office of Woods and Forests. The new pr will be erected to a design in conformity the Crown's scheme of reconstruction fo thoroughfare, and approved by Mr. Murray, F.R.I.B.A. Of seven stories in h the building will have extensive shop wi and showrooms on the ground and first and offices in the remainder. There w large basements, containing stores, h chamber, fuel, &c. The principal elevati be carried out in Portland stone, with ornat art metal fittings and window case A steel framework will support the main The floors will be of fireproof constru A lift will serve all floors. External fire-staircases will be provided. Heating central low pressure hot-water systen electricity for lighting and power will stalled. The roof will be of concrete, of M type, and covered with slates. The ar is Mr. Robert Atkinson, F.R.I.B.A., Bedford-square, London, W.C. 1.

W INVENTION

CONCRETE COTTAGE CONSTRUCTION.

system of concrete wall construc-n as the "R.C.C." system, has ted by Messrs. The Rogers Con-Co., Ltd., of 9, Park-place, St. W.1. The feature of this system forcement, which takes the form of of sheet steel from 26 to 30 gauge s shown in Fig. 1. The four tri-ieces in each of the forty-eight ampings in the steel sheet are bent rds and two inwards so as to form

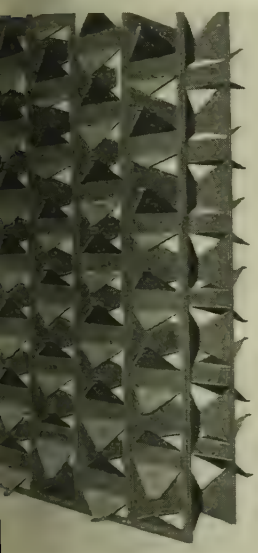

FIG. 1.

ion of Sheet of "R.C.C." Reinforcement.

wings, projecting from each face of Two of these sheets are then placed e and fastened together by clips tangs on each sheet where they juxtaposition.

ct of this type of reinforcement is 1) to impart tensile strength to the 2) to make it possible to release shuttering sooner because of the support given to the concrete by the tangs which are embedded in it, as shown in section in Fig. 2. It is also claimed that to a certain extent the reinforcement acts as a vertical dampcourse, and that any moisture which might penetrate the wall from the outside will be checked by the sheet metal in its centre and be conducted downwards. Any design may be followed with the reinforcement, as it may be readily cut on the site with shears.

The method of constructing walls with this reinforcement is as follows. The footings are laid with a longitudinal groove (1 in. in depth) in order to give a bond to the wall (see Fig. 2). Timber uprights are then placed at intervals around the building, as seen in Fig. 3, at distances apart according to the length of the shuttering units to be used, and as these are raised by hand a length of about 10 ft. is found convenient. These uprights are braced to be perfectly vertical, and serve as guides for the shuttering, thus ensuring the wall being built true. Similar uprights are erected on both sides of the wall. Those on the outside are built to the full height of the wall to be built. The uprights on the inside, if the building is to be of more than one story, are erected to the height of the first story only; they are then taken down and re-erected on the first-floor joists to continue the wall upwards, and so on for any number of stories.

After the footings and uprights, or shutter-guides, are in place, the shuttering is placed in position for the first pour. The shuttering used is of timber with a steel plate on the face to facilitate drawing it upwards and to obtain a good surface finish to the concrete. On each side of the uprights is a steel angle throughout its length, and inside this and resting against it outwardly the shutters are placed. They are not fixed in any way, the steel angles on the uprights preventing them from being forced outwards by the weight of the concrete, which also prevents them from falling inwards. The shutters are 15 in. in height, and are provided with a top board sloping inwards which guides the concrete down between them. Sheets of reinforcement are then placed in position in the middle of the shutters and concrete placed from each side simultaneously and tamped into the space between the two locked sheets of steel. In placing the reinforcement the sheets are erected alternately with one standing on end (6 ft. high by 2 ft. wide) and three superimposed one above the other on edge, filling an area 6 ft. by 6 ft.

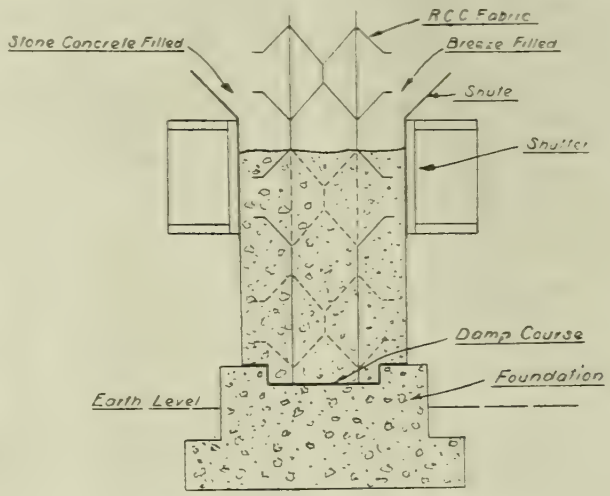

FIG. 2.

Section of "R.C.C." Walling.

It is possible for two men to fill shutters 10 ft. long by 15 in. deep in about 30 minutes. They then lift the shutters 6 in. higher and again fill them, and so on to the top of the wall. The concrete is thus left unsupported very soon after it is laid, and it is in making possible this rapid release of shuttering without waiting for the concrete to set that the chief advantage is claimed for the system, in that it is claimed that it is the support given to the concrete by the projecting tangs on the reinforcement which permits the shuttering to be removed so soon. This speedy removal of the formwork also makes it an easy matter to brush off the surface film of cement and expose the aggregate, and this method of surface treatment is adopted by the patentees for buildings erected on their system.

As will be seen, the reinforcement, being in the form of perforated sheets, practically divides the wall into two leaves. This is taken advantage of to form a wall of weather-proof gravel concrete on the outside and a breeze concrete, to avoid condensation, on the inside, and as the gravel and breeze concrete are placed simultaneously, and to a certain extent intermingled as operatives on each side of the wall tamp between the reinforcement, an excellent bond is obtained. Interior partition walls are built entirely of breeze concrete, with only one sheet of reinforcement.

This system obviates the necessity of searching for any skilled labour for the erection of the shell of a house, and, we are informed, works out at about 25 per cent. less cost than brickwork.

air of "R.C.C." Houses Three Days after Foundations are in.

LAW REPORT

Shoreditch County Court.

In the Shoreditch County Court, recently, before Judge Cluer, Messrs. Gibson's Furniture Factories, Ltd., of 164, Hackney-road, E., sued Mr. Godfrey Gratten, of 59, Westbourne-road, Addiscombe, Croydon, constructional engineer, to recover £13 6s. for bricks supplied. This was a side-line of the plaintiffs. The defence was that he, on July 31, gave an order for 30,500 bricks at 77s. per 1,000, according to the sample shown him, which was 4 in. by 8¾ in. by 2¾ in. Those delivered, however, were much smaller, measuring only 3½ in. by 8¼ in. by 2¼ in., with the result that he had been put to a very heavy extra cost for bricklayers, mortar, &c., due to the smaller bricks, and he counter-claimed £37 12s. 4d.

Mr. Bracknell Powell appeared as counsel for the plaintiffs, and Mr. G. Oakes, barrister, for the defendant.

Mr. George Cundell, director and secretary of the plaintiff company, said they admitted that the bricks supplied were not entirely in accordance with the sample, so accordingly he saw the defendant and made an arrangement that 1s. per 1,000 should be allowed, and that had been taken off. He agreed that as they were smaller they would cost more to lay.

Judge Cluer remarked the Romans built a beautiful aurelium wall round Rome with small bricks, and those of the Colosseum were smaller still.

In cross-examination, the witness denied that he ever agreed to make an allowance of 10 per cent. Some sample bricks were produced, and pointing to the smallest one, the defendant said that, "approximately the bricks supplied are the same size as that."

Mr. Gratten, in evidence, said that when they were delivered on the Saturday afternoon, or the first part of them, he saw they were wrong, and telephoned the plaintiffs to take them back. They asked him to accept them as they were on the road, and he had no alternative therefore.

Continuing, the defendant said that he never agreed to take 1s. a 1,000 less, but always said it was totally inadequate, because 75 of the bricks were small ones. He estimated the cost of labour and material cost him £30 extra.

In giving judgment for the plaintiff for £13 6s., and costs, Judge Cluer said the defendant had lost his case through not repudiating the letter of August 2, which made an arrangement for a reduction of 1s. per 1,000.

Proposed Ludgate Circus Overhead Roadway.

At a recent meeting of the Court of Common Council at the Guildhall, it was proposed by Mr. Walter Spyer that it be referred to the Improvements and Finance Committee to consider and report as to the possibility of providing an overhead roadway across Ludgate-circus from Farringdon-street to New Bridge-street, and the probable cost thereof.

Westminster Women's Housing Council.

Housing Councils were formed in different parts of the country in 1917, their policy being to co-operate with various housing authorities, to remove bad housing conditions, and to secure an adequate supply of healthy homes. At a meeting held at 10, Eaton-square, S.W., on Tuesday last week, Miss Berry (Secretary, Women's Local Government Society), spoke on the powers of local authorities to acquire new building sites and to assist landlords in the upkeep of their properties by paying for repairs and recovering the costs spread over a period of years. Mrs. Walter Runciman directed attention generally to the bad housing conditions in Westminster, where 6,914 basements are used for dwelling purposes. Mr. Keay (Professional Workers' Association) also addressed the meeting on the question of better accommodation, especially for less well-paid staffs who are often forced to work in basements of houses which have been taken over as business premises, without proper conversion.

WARWICK.—Plans passed by the T.C.: Two houses, Beauchamp-road, for Messrs. Crosbee & Atkins; house, Brook-street, for Mr. Alcock.

WATH-ON-DEARNE.—Application has been made to the M.H. for sanction to borrow £1,800 for the improvement of the water supply.

WEARDALE.—The R.D.C. has passed plans, submitted by Mr. Geo. Thompson, for the erection of an auction mart at St. John's Chapel.

WELLINGTON.—The U.D.C. passed plans: House, at Seymour-street, for Mr. E. Hookway; and a bungalow at Ford-street, for Mr. Gray.

WEMBLEY.—Another secondary school is to be erected.

WESTGATE.—Wiltshire C.C. has a scheme for the acquisition of the Leighton House grounds of 50 acres, and proposes to erect an institution for mental defectives. It is suggested that accommodation should be provided for 540 patients. The cost is estimated at £90,000.

WEST HARTLEPOOL.—The Corporation has received permission from the M.H. for the immediate erection of 100 houses on the Raby Estate.

WESTON-SUPER-MARE.—Formal consent of the M.H. had been received by the U.D.C. to the appropriation of four acres of land in Bridge-road for the erection of 50 workmen's houses. Plans and specifications were practically completed and the surveyor was instructed to obtain tenders.

WHITBY.—A scheme of extensions are to be carried out at the Council offices, at an estimated cost of £2,200.—Plans passed: Four houses at Stakesby; two pairs of semi-detached houses at Stakesby.

WHITLEY.—Plans passed: Two houses, Evesham-avenue, for Mr. Mather; house, Grange-park, for Mr. S. J. Short; three houses, Evesham-avenue, for Mr. J. M. Dawson; two houses, Uplands, for Mr. Dodsworth; house, Davison-avenue, for Mr. J. M. Dawson; house, Monks-road, for Mr. G. Wilkinson; house, Uplands, for Miss Minnis.

WILTS.—The E.C. propose subject to the approval of the C.C., to provide new elementary schools at Devizes (cost £10,500), Bradford-on-Avon (£4,050), Calne (£6,000), and Bratton (£2,430).

WIMBLEDON.—It is proposed to erect conveniences in Haydon's-road recreation ground and Garfield-road recreation ground.—A site is to be secured for the erection of a day nursery.—Plans passed: House, Dora-road, for Mr. R. Sharp; house, Conway-road, for Messrs. Whitehead & Co.; house, Cottenham Park-road, for Mr. Walker; house, Ridgway, for Mr. A. V. Farrier.

NEW BUILDINGS

Wembley.—Building operations are in progress in connection with the new Wesleyan Methodist Church at Wembley. The new building has been designed to seat about 600, and will be carried out in brick, relieved with stone dressings for windows, door linings, &c. The floors will be of wood blocks, whilst a heating and electric lighting system will be installed. The contractor is Mr. Thos. Shillitoe, of 3, Electric-parade, London, N.3. The architect is Mr. A. E. Lambert, of 28, Park-row, Nottingham.

Westcliff-on-Sea.—A new church and school are to be erected at Crowstone, for the local congregational community. The edifice will be built of local brick with stone dressings, and will accommodate about 500–600 persons. The architects are Messrs. George Baines & Son, F.R.I.B.A., of 121, Victoria-street, London, S.W.1. The builders are Messrs. J. Jarvis & Sons, Ltd., of 8, Wormwood-street, London, E.C.2.

Bushey, Herts.—The governors of the Royal Caledonian School at Bushey, Herts, have under consideration the erection of additional buildings in order to augment the recreation room and workshop facilities of the school. The new premises will be erected to a design in conformity with the present buildings, and the plans are now being prepared. The architect is Mr. F. W. Troup, F.R.I.B.A., of 14, Gray's Inn-square, London, W.C.1.

A NEW ROADLESS TRACTOR

AT a largely attended demonstration at Shrewsbury last week, the capabilities of a new production of the "Sentinel" Waggon Works, Ltd., a roadless tractor, was shown in a practical manner. The tests carried out showed the tractor surmounting tree trunks, going up inclines, through ponds, and hauling on a muddy and slippery road. As a timber hauler, its usefulness was demonstrated by a cinema display, in which the tractor was seen loading and hauling felled timber through a slippery and muddy woodland, where a grip of the surface appeared impossible. Colonel Clarke explained the mechanism of the tractor, and the following tests were undertaken: Demonstration of tractor drawing a large load; climbing and descending steep hills; slow demonstration of the movement, of the tracks, and control of the vehicle; demonstration of silence of tractor on hard roads; going through ponds; demonstration of the action of the track in swallowing up obstacles and the swivelling action of the front axle; demonstration of turning radius and of drawback pull, by means of a dynamometer. The whole of the tests, though severe, were successful. The tractor is 7½ ft. long. Illustrated and descriptive booklets of the technical details of this new "Sentinel Roadless" Tractor can be obtained from the Sentinel Waggon Works, Ltd., Shrewsbury.

A New Roadless Tractor.

THE SCOTTISH BUILDER

GLASGOW ACADEMY WAR MEMORIAL

The Glasgow Academy War Memorial, which has been erected at the junction of Colebrooke-street and Great Western-road, was unveiled on November 11. The memorial is the third and final instalment of the scheme, which embraced the endowment of the school, the erection of panels within the school containing the names of those who died on service, and the incorporation of a memorial in the enclosing wall of the grounds bearing a commemorative inscription. The unveiling was performed by Colonel Sir Robert C. Mackenzie, chairman of the governors. The memorial is incorporated in, and forms a prominent feature of the school wall at the western angle on Great Western-road. From the piers at each end the wall sweeps inward in crescent shape to a large dedication panel forming an elevation in the wall. The panel is surmounted by a frieze, on which is carved a memorial wreath. Fluted pilasters are placed on each side bearing the palm branches of victory and the dates of the foundation of the school and its reconstitution, 1845 and 1923. The memorial was designed by Mr. A. N. Paterson, of Messrs. Paterson & Stoddart, architects, Glasgow.

Dalkeith High School.

Midlothian is about to spend £16,500 on extensions to Dalkeith High School, making provision for housecraft, handcraft, chemistry, physics, art, gymnasium, and staff rooms.

Glasgow Housing.

At a recent meeting of the Glasgow Dean of Guild Court authority was given for the erection of about 380 additional houses in the city. An important application was by the Corporation, and had reference to the extension of their Hamiltonhill scheme by 350 tenement houses of two and three apartments, with scullery and bathroom.

LEITH DOCKS

Plans of dock extension on the lines of the Commissioners' decision of last February were generally approved at a recent meeting of the Leith Dock Commission. The plans show several changes on the previous ones. In a report Mr. A. H. Roberts, M.Inst.C.E., the Docks Engineer, stated that under the plans the breakwater would be 400 ft. longer than was proposed under the 1913 Act authorising extension An additional ten acres of space would thus be secured. There would be 17 acres of water space in the first instalment of the proposed dock. Of the total area to be reclaimed about eight acres would lie to the westward and about 34 acres to the south and east of the new dock. To the south a lagoon would be left to be gradually reclaimed by deposits of dredgings in preparation for the ultimate completion of the northern arm of the dock. General estimates prepared showed that the breakwater would cost £426,000, and that the dock works might be carried out for about £655,000, the existing borrowing powers—£1,200,000—would, therefore, be sufficient to cover the work of the next ten years.

Alloa's New Post Office.

A commencement has recently been made with the clearing of the site at Mansfield, Bedford-place (opposite the War Memorial), for the erection of a new Post Office for Alloa. The new Post Office will be of one story to the front, with under-buildings behind, and the cost is estimated at between £6,000 and £7,000. Mr. R. M'Gee, builder, Tillicoultry, is the contractor for the whole of the work.

Fettercairn Fire.

Damage estimated at between £2,000 and £3,000 was done in the courtyard of Fettercairn Distillery recently. A large wooden building, measuring 120 ft. by 80 ft., was completely destroyed.

BUILDING TRADE WAGES IN SCOTLAND.*

The following are the present rates of wages in the building trade in the principal towns of Scotland. Every endeavour is made to ensure accuracy, but we cannot be responsible for errors that may occur:—

TRADE NEWS

The Riverina Overflow.

vatory overflow and waste are the centre of the lavatory. On them he safety, sweetness, and cleanliness aratus. But there are more insanitary d overflows on the market than of the l cleanly ones. The accessible safety is very simple to construct, although re costly, but it is easily cleansed and et, fresh air passing throughout; t can be periodically cleansed with a rush. Nearly twenty-eight years ago lorrison, Ingram & Co., Ltd., of Hygeia

nchester, patented the Riverina cir- flow shown in the diagram, and it is claim, the premier thing of the kind he Clænairo overflow, though oval, is ne lines, and is quite safe for any water. It is important to be certain overflow is *safe*. The saving in ween an unsafe and perfectly safe, lavatory is not worth the risk. nt point for every proprietor to about before ordering lavatories he overflow and waste safe and ? In any case, every lavatory fixed be tested to the *maximum* pressure cold water running through ½-in. taps e fitness of the overflow, waste, and ng a safe margin with the plug in.

---

received from Messrs. The British g Company, Ltd., 54A, Parliament- eminster, S.W.1, a bulletin—which can pplication—describing their system of st *in situ* concrete piles. The princi- sf the "Vibro" system are its economy state, 50 per cent. cheaper than of pre-cast concrete piles); its 40 ft. pile can be completed in one the solidity and uniformity of the ed. These are cast *in situ* and are d into the ground throughout their ids are impossible. Every pile is, a perfect column of compressed, solid d all guess-work is eliminated. The t in the ground the required depth, o the mode of casting, fit the holes y perfectly. It is unnecessary to rehand what depth of piling is d "Vibro" piles can be driven to and need not be reinforced. "Vibro" be damaged in driving; a valuable n.

---

received from Messrs. Clark, Hunt Shoreditch, E.1, a brochure which summary of the growth and present business from 1828–1924, nearly ars of continual progress. Starting may say so—the humble origin of a monger, it has developed into an organisation which includes general builders' ironmongery of every description. A visit to this well-known house is certainly the only way fully to realise its potentialities.

Messrs. Jenson & Nicholson, Ltd., Goswell Works, Stratford, E.15, send us a manual on the treatment of damp walls. Those who have had trouble with this difficult problem will be interested in the notes on the preservation of masonry, brickwork, and cement work, &c. Their preparations are made for both inside and outside use, and although the most effective way of treating a damp wall is by prevention, it often happens that such a course is not practicable. Their object in issuing this booklet is to assist those engaged in the prevention and cure of damp in selecting the right material for the particular work in hand. "Nepthlene," "Fossolite," "Sealite," and "Anti-dampine," are all preparations specially manufactured by this firm with this object in view.

Messrs. Perkin & Co., Ltd., Leeds, inform us they have recently fitted up a travelling workshop containing Spindle Moulder, &c., which they are sending round the country demonstrating their "Rapid" Stair Housing Attachment. The appliance is designed, primarily, for the economical production of stair housings, and on this particular work shows a saving in time, they state, of 90 per cent. against hand work, as well as a very much better finish and greater accuracy. A pair of strings, which would take a capable joiner eight hours to mark off and trench by hand, may be completed in thirty minutes with practically no marking off or previous preparation. The cost of the apparatus, it will be seen, is therefore saved in the production of less than twelve staircases. It consists of an adjustable graduated templet which may be readily set to trench stair strings between the limits of 5 in. to 9½ in. rise and 7 in. to 12 in. tread. The templet is designed to do a pair of strings, *i.e.*, R.H. and L.H., without resetting, thus ensuring perfect matching of the two strings, besides saving the operator's time.

OBITUARY

THE death occurred recently, at Westbrooke, Hexham, of Mr. Samuel Andrew Short, aged 61, founder and head of the firm of Messrs. Samuel A. Short & Son, builders' furnishers hardwaremen, and joinery tool warehousemen, of Newcastle.

The death has occurred of Mr. William Edward Isaacs, builder and contractor, Sketty (Glam), at the age of 48 years.

Mr. Thomas Evans, builder, Penlline-road, Whitchurch (Glam), has died at the age of 61 years.

The death has taken place of Mr. John Pritchard, Brynterion, Risca, Mon, builder. He built a number of municipal offices and churches in the area.

Kirk Sandall Church Hall.

A new church hall, erected at a cost of £3,500, was recently opened at Kirk Sandall by Lord Cozens Hardy. The joint architects of the hall are Professor Abercrombie, of Liverpool, and Mr. T. H. Johnson, of Priory-place, Doncaster. It is constructed of rustic-faced bricks which were made at Messrs. Pilkington Bros. brickworks, at St. Helens. There are stone dressings, and a red tiled roof, surmounted by a bell cote. The hall has seating accommodation for 250 people, and provision has been made for a gallery to be inserted at a future date. Electric lighting has been installed, and the current will be obtained from Messrs. Pilkington's works. There is a low pressure hot water system of heating. The contractors for the building were Messrs. Johnson & Moore, of Balby-road, Doncaster.

TENDERS.

Communications for insertion under this heading should be addressed to "The Editor," and must reach him not later than Tuesday evening.

THE BUILDER

JOURNAL FOR THE ARCHITECT AND CONSTRUCTOR

WITH WHICH IS INCORPORATED "THE BRITISH ARCHITECT."

—No. 4269. NOVEMBER 28, 1924.

ARCHITECTURE AND THE SOCIAL STATE

THE inaugural paper—of which we gave an abstract—delivered at the Architectural Association by the President, Mr. H. S. Goodhart-Rendel, provides an excellent example of that form of criticism which is necessary to preserve a healthy state of mind. His Yesterday and To-morrow," has a significant meaning : challenge to those who believe in architectural free will. areful reading of this thoughtful paper makes it clear to the difficulties confronting the architectural critic are understood by those who clamour for sparkling criticism. in agreement with him when he says that what yesterday e, was done too lately for us to see it dispassionately. age, we suppose, finds the age which has immediately d it the hardest of all to understand, and therefore it. We quote Mr. Richard Middleton from " The Day Yesterday " : " Of all the intellectual exercises with e solace the idle hours that we devote to thought, none engaging and at the same time perplexing than that of uring to form a clear conception of the age in which Naturally, the difficulty lies, not in lack of materials h to base an impression—indeed, we are embarrassed uality of evidence that accumulates to our hands—but ct that it is hard to see things in true perspective when very near to the observer."

itecture, in spite of its great name, may have had ncy to become stereotyped and monotonous in its rds and formulas, and it is evident that its claim to eriority, moral and intellectual, over the other develop- mankind should not be allowed to become rigid. It ore, essential that the architect should be on his guard the conventional or negative outlook ; he should ır to see life steadily, and see it whole. Criticism is y stimulant, and critics of architecture will appreciate l and audacity of Mr. Goodhart-Rendel, whilst g the rightness of most of his judgments. He serves criticism equally to the architect and to the public. ares what the public wants with what the architect e the public to want, and by inference we assume that ulties are to arrive at how far the architect must ise, or by what means he can persuade the public to m.

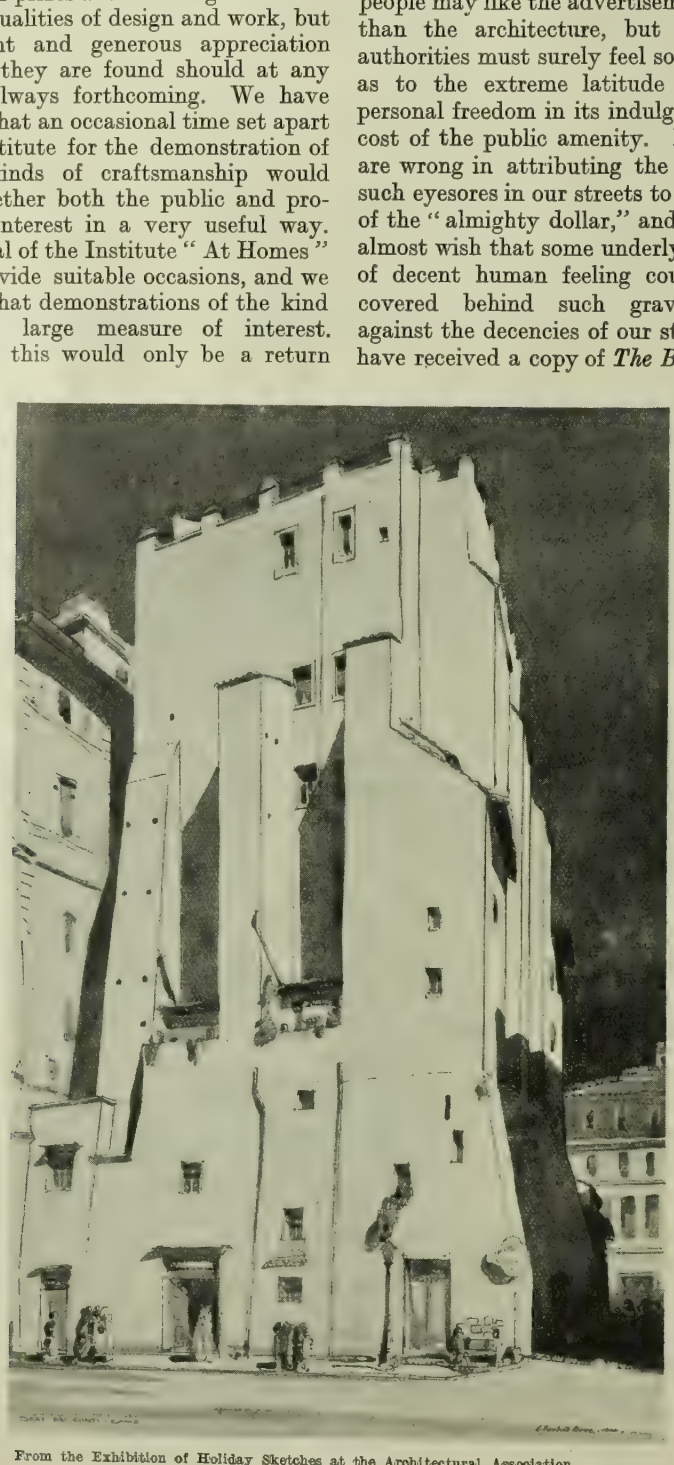
n interesting line of thought to ascertain whether the of architecture is ahead of the public, or the social such a thing can be imagined), and how far it is itself to social conditions. That there is a powerful nd the architect and architecture is certain, but if we s as a fact we have not yet defined the position of the in the modern state. Architecture, in its broadest ne of the most important factors in social life, but it to say whether it is an absolute expression of the spirit e, or something better. We deplore the loss of old eet, but if we inquire into the social state we find quiet, graceful and dignified street was produced by puted to be the flashiest and most vulgar in Europe. it difficult to reconcile the well-bred grace of the archi- th a profligate and ostentatious age, we are forced to t to John Nash and his architect friends. Similarly, ult to say that the new buildings are indicative of s and uncertain age (they are probably much better), safe in saying that they indicate a radical change in state.

Mr. Goodhart-Rendel criticises the buildings in Regent-street from the architectural standpoint, but, apart from any architectural lapses, it appears to us that it is the social problem which has played havoc with the charm of the old street. The buildings are higher ; they jostle and compete with each other ; and the ragged skyline no longer permits of the beautiful play of light and shade on the delicate modelling of planes and curved surfaces. We feel that the street is narrower, that it is no longer a sunny thoroughfare. There are several matters for serious reflection concerning Regent-street. The perishable nature of Nash's buildings gave rise to the well-known quatrain from the *Quarterly Review*, but it is apt to be overlooked that these stucco buildings lasted so long (yet less than a century), that they had to be torn down to make way for another age with different needs and wants. In the new buildings Portland stone has been substituted for plaster, but an appearance of permanency has only a relative value when we cannot prophesy what posterity will demand. Again, one of the great advantages which Regent-street possessed was that it was designed and carried out under an Act of Parliament which aimed at making one of the most beautiful streets in Europe. Practically the whole of the land is Crown property, and we understand that the Commissioners of Woods and Forests pass all designs and lay down any restrictions they desire. It is, therefore, reasonable to assume that the general lines of the old buildings could have been maintained had the desire been there. Short of this, there are those who think that the Crown supervision has not produced a better result or more uniformity of design than can be seen in many other streets where the ownership of the land is in different hands. The broad fact is, we are dealing with a social problem involving the demands of the public, the shopkeeper, and the lure of increased land values. It is one of the paradoxes of civilisation that the fascination of the shops has led us to destroy what was a fascinating shopping street. Whether the new Regent-street is a better shopping street is open to question ; it is a street of large shops instead of small shops, and instead of architectural unity we have a hundred separate entities. The architect, if he is not powerless in these matters, is compelled to work within certain well-defined limits, and in expressing a phase of civilisation which he may dislike he is all the time striving to make it appear better than many people would consider it deserves. It is, perhaps, a forgivable weakness to wish that the Crown authorities had made the financial sacrifice which we would never entertain as individuals.

There are those who maintain that the high-water mark of excellence in certain forms of architectural design was passed somewhere about the eighteenth century, yet they would not deny that we might reasonably look for a better result in Regent-street were it now only being considered, instead of being completed. Kingsway, as a whole, is decidedly a finer street (considering its purpose) than we would have expected from the standard of architectural design, say, forty years ago. We believe that the architects of to-day have a surer grip of fundamental principles, and that they do their best to embody certain essential qualities inherent in all good architecture. And this at a time, be it remembered, when the condition of the social state is considered by many to be unfavourable to the production of great architecture. We have left the period behind when there might have been some analogy between architecture and this parody on literature from the *Referee* :—

" Little bits of Walpole,
Little drops of Dell,
Scattered over England,
Pay extremely well."

NOTES.



Craftsmanship. THAT the proper understanding of craftsmanship is of the first importance to architects none can deny, and it is therefore with pleasure that we note the special efforts which are being made by the R.I.B.A., on the initiative of the Art Committee, to concentrate thought on means for the better study and encouragement of sound craftsmanship. We cannot provide the instinct of good design in the crafts, but we can encourage and develop it wherever it is found, and we can at least provide sound teaching on the technical and practical side. It is doubtful how far prizes and awards go to stimulate fine qualities of design and work, but a constant and generous appreciation wherever they are found should at any rate be always forthcoming. We have long felt that an occasional time set apart at the Institute for the demonstration of various kinds of craftsmanship would bring together both the public and professional interest in a very useful way. The revival of the Institute "At Homes" would provide suitable occasions, and we are sure that demonstrations of the kind ensure a large measure of interest. After all, this would only be a return to former policy, but the establishment of a special committee is a new and wise development. The development of interest in the crafts should tend to remind us all of the value of individuality and that there may still exist alleviations to our very machine-made existence.

Disfigurement of Street Architecture. WE gave an example on October 17 of the way in which the quest of money values is allowed to deface and vulgarise our streets. This example showed about the extreme limit to which advertising enterprise can go. We can understand the possibility that many people may like the advertisements better than the architecture, but our public authorities must surely feel some concern as to the extreme latitude allowed to personal freedom in its indulgence at the cost of the public amenity. Perhaps we are wrong in attributing the increase of such eyesores in our streets to the pursuit of the "almighty dollar," and one might almost wish that some underlying motive of decent human feeling could be discovered behind such grave offences against the decencies of our streets. We have received a copy of *The Builder* from one of our public libraries in reader of our issue of Octobe written all round our illustration comments on this striking obj are glad to note even this solitar but we wonder whether any poss grounded reason can be found public should be so afflicted. a building does not yield a goo return we might find some pu which would provide a dole to case.

Ca-Canny. CA-CANNY, and all implies, is pertine in a letter to t this week (sign Harris"). We all suffer from even the best of us, and who c that the British workman, wh best, is a fine and reliable work fully appreciate the futility of a implied in ca-canny if he could b to realise it? We need light— air cure. The trade unions much to help us all on the prosperity, but we believe tha understanding of the issues b would bring the average British into line with the only possible a an increase in the general pros workmen and masters alike. workman can lay 800 bricks in on may sound almost incredible, b just been done, if the fact i recorded. Between 600 bricks a 800 an hour, what a dreary s ca-canny exists!

The City Churches. ONCE more these with a determi slaught. The U Benefices and Dis Churches (Metropolis) Measure passed by the Church Assembly promoters will soon be in a po begin demolition, unless Parlia be persuaded to prevent th danger is so great and so immi we urgently recommend those w the destruction of Wren's works at once to their members of P pressing the rejection of the made by the Church Assembly. that to write letters of this kin an effort. Let us make that once. It is utterly useless to say it is a pity, but that it c helped. The decision rests wit ment, and the attitude of tha largely dictated by the feeling i stituencies as shown in lett private individuals.

Church Champions. FORTUNATELY, w active champions be relied on to defe churches to the Sir Reginald Blomfield and Sir Fletcher, to mention only two We shall be placing ourselves i paradise if we listen to any

vals ecapi-ns.

NEITHER let us listen to any proposals for removing the churches to the suburbs, nor yet for cutting their heads ing the bodies, and turning the into pigeon lofts. The Church ly seems to possess no imagination. ot visualise the churches used for urposes; it cannot see the con- f Church of England bankruptcy in admitting that while the will always pay for their cinemas lic houses they will only think it hile to save their souls if they can rches for nothing. They must tly never be asked to make any for their church as this would great a strain upon their religious

ban re-s.

As was natural in the course of such a controversy an exaggeration of statement has been observ- both sides. The churches are es spoken of as monuments of ual beauty, which they are not. e good churches of their time. e at which they were built was burdened with passion or inven- they are characteristic of it and nts of historical and sufficiently alue to be cherished, and for sterity claims our regard. On r hand the "longing to save n the part of the clergy leads undervalue the witness of these to the piety of the builders and mple to us, nor do they attach value to the opportunities, nd social, which they should be provide for the 400,000 day- whose souls have also to be his is not to withhold sympathy fficulty of providing means to ne demands for more church lation of populations—such as at Dagenham—which have grown from 6,000 a few years ago to 40,000 at the present time. The historic value of the City churches is not to be sacrificed, nor their service to the multitude ignored, to provide accommodation elsewhere.

Disposal of Churches Bill.

IN an article in our contemporary discussing this Bill, we are told that "This measure goes to Parliament frankly as a means for destroying churches and not for preserving them, and everything in it is heavily weighted in favour of clerical opinion." We are told elsewhere to believe that the Benefices Board is to be trusted, and that its influence will not be predominantly "clerical." Even if this were the case and the Board does not approve the scheme, after five years, as pointed out in Sir R. Blomfield's letter—the Bishop can set the ball rolling again. It is this prospect that invalidates the securities which the Board is supposed to possess, and explains the reason for objection to any measure which includes proposals for the destruction of the City churches.

Housing and the Speculating Builder.

WE give on p. 869 an abstract of an admirable address on the "Housing Question," by Mr. J. E. Drower, C.B.E., before the Surveyors' Institution (South Western Branch), in which the lecturer showed that the speculating builder was very far from dead, but that he had left the housing of the working classes alone because even he could not make it pay, and had turned his attention to another style of house and built to sell. We agree with the lecturer that the services of the speculating builder of houses for the working classes ought not to be lost to the community, and that, by "carefully guarding subsidies and reasonably restricting rents," we may enable the speculating builder once more to turn his attention to this class of building.

Misdirection of Employment.

IT has taken the nation a considerable time to recognise that the payment of the dole without employment was adding only a further evil, even though unavoidable at a time of crisis, and it is seen that to find employment is not only economically but morally much better. It has not, however, been sufficiently understood that employment on productive and needed public work is the direction to be followed; jobs were often artificially provided, not because the work was wanted, but to keep men employed. This has been in a degree the case in regard to roads, and work has been done with much injury to the countryside that might well have been avoided.

From the Exhibition of Holiday Sketches at the Architectural Association.

Ronda. By MR H. THA TUN.

GENERAL NEWS

Professional Announcement.

Mr. A. Vivian Jackson, architect, has opened an office at Wellington College Station, Berks.

Mr. R. N. Stroyer, M.I.Mech.E., consulting engineer in reinforced concrete, has removed to No. 224, Abbey House, Victoria-street, London, S.W. 1.

Builder's Estate

Mr. Thomas Rees Price, of Cartref, West Hill-road, New Parks, Leicester (net personalty, nil), £16,841.

Royal Sanitary Institute.

The next congress of the Royal Sanitary Institute and Health Exhibition will be held in Edinburgh from July 20 to 25, 1925, by invitation of the magistrates and City Council.

Art-Workers' Guild.

At a recent meeting of the Art-Workers' Guild, at 6, Queen-square, Bloomsbury, Mr. Gilbert Bayes, sculptor, was elected Master for the ensuing year.

Royal Academy.

At a General Assembly of Academicians and Associates held recently, Mr. Terrick Williams, painter, and Mr. Walter Sickert, painter, were elected Associates of the Royal Academy.

The Church Building Society.

At the last meeting of this Society Mr. F. C. Eden, M.A., F.R.I.B.A., and Mr. Robert Atkinson, F.R.I.B.A., were duly elected to the Society's Committee of Honorary Consulting Architects.

Royal Welch Memorial.

Lieut.-General Sir Francis Lloyd, the colonel of the regiment, recently unveiled a memorial to the Royal Welch Fusiliers at Wrexham. The memorial, which consists of bronze figures, was executed by Sir Goscombe John, R.A. The Archbishop of Wales dedicated the memorial.

Wigan War Memorial.

The Wigan Corporation war memorial, which will be situated in the Public Gardens in front of the Parish Church, has been designed by Sir Gilbert Scott, R.A., of Westminster, the architect of Liverpool Cathedral. It is proposed to unveil it next year.

Welsh Housing Scheme.

Messrs. Courtaulds, Ltd., are prepared to consider propositions for the erection of 100 houses for their workpeople at Flint, North Wales. Rapidity of construction is the primary consideration. Address communications to Courtaulds, Ltd., Engineer's Department, Coventry.

Architects' Estate.

Mr. Harvey Dyball, of Cannon-street, E.C. and of Warwick-square, S.W., architect (net personalty, £7,552), £8,993.

Mr. Thomas Edward Collcutt, of West Lodge, Totteridge, Hertfordshire, and late of Bloomsbury-square, W.C., President of the Royal Institute of British Architects, 1906–08, designer of the Savoy Hotel and the Imperial Institute, £19,074.

Buxton Building Trade Course.

The students who are taking the building trade course connected with the Buxton Evening Continuation Classes were recently taken over the New Mills Secondary Schools to study the architecture and construction of the schools. Mr. G. H. Widdows, F.R.I.B.A., the County Architect, was responsible for the plans of these schools.

R.I.B.A.

At the third general meeting, on December 1, the following notice of motion by Mr. Francis Hooper, seconded by Mr. H. D. Searles-Wood, will be considered: "To request the Council to consider and if thought desirable to approach the Master Builders' Association and the Building Trades Union, and to offer any assistance deemed suitable in furthering the training of craft apprentices."

Acoustics and Competitions.

Mr. G. A. Sutherland, writing recently in the Press, states that the first work of the Advisory Committee on Acoustics will be the issue of a set of principles of acoustic design, conformity to which will be one of the conditions laid down for all designs submitted in the international competition for the new League of Nations Conference Hall at Geneva.

Architecture Entrance Scholarships.

Fifteen Entrance Scholarships and Exhibitions are available for award to students entering University College, London, in October, 1925. Two of these are tenable in the Bartlett School of Architecture. Three others are available in any faculty of the College or in the School of Architecture. Full particulars regarding all the Scholarships and Exhibitions may be obtained on application to the Secretary of the College.

Building Trades Employers.

At the recent annual meeting of the Birmingham Association of Building Trades Employers, the council's report said that arrears of work, caused by the national stoppage, emphasised the acuteness of the main problem before the ndustry, *i.e.*, the shortage of craftsmen. This was the problem the solution of which would take time. Mr. H. H. Crump, who was unanimously re-elected President, said he hoped the recent troubles would lead to a better understanding between employers and employed.

A Nash Centenary.

All Souls' Church, Langham-place, one of the few remaining buildings of Nash's Regent-street, celebrated its centenary on Tuesday last. The interior of the church was recently redecorated in olive green and gold, and several alterations have been carried out, making for enlargement both in the church and in the vestries. The renovations have already cost about £4,000, and about £3,000 is required to complete the scheme. The architect for the work is Mr. H. S. Goodhart-Rendel.

Building Apprentices.

A scheme for the training of apprentices in the building industry was recently approved and recommended to local authorities for adoption at a conference of the Lancashire and Cheshire Housing Authorities. The scheme, which has secured the support of representatives of employers and workers in Manchester, provides for the technical training, to be provided by the Manchester Education Committee under the regulations of the Board of Education, of youths, resident within the City of Manchester, between school-leaving age and 20. Practical training to be provided by employers is also approved by the scheme. Mr. H. R. Aldridge, secretary to the National Housing and Town Planning Council, stated that the scheme would be considered at Birmingham, Newcastle, Nottingham, and Bristol, and that schemes for the adoption of alternative building materials would stand aside if it could be proved that ample supplies of bricks, stone and skilled workers were available.

Modern Brick Laying.

With reference to a statement which recently appeared in the press that a foreman engaged on the Treeton Housing Scheme, near Sheffield, laid 809 bricks in one hour, the London Federation, we understand, say that the average speed for London is 50 bricks an hour, which represent 400 a day. It has been claimed that the average day pre-war work was from 1,000 to 1,400 a day.

Crane Collapse.

A hand-crane weighing two tons, working on the foundations of the new headquarters of the Society of Friends, in Endsleigh-gardens, Euston, N.W., recently collapsed while hoisting a steel stanchion.

COMPETITION N

Oldham Union.

The design of Messrs. C. T. Ta Roberts has been placed first by the in a competition for the extension of Nurses' Home. The plans will be view shortly.

Constantine Technical Colleg

Mr. Percy E. Thomas, F.R.I.B.A appointed assessor in the original c informs us that as the Middlesbr mittee has been presented with a f of £40,000, bringing the total up a revised schedule of accommodatio being prepared, and it is hoped to conditions of competition in a fe

Modern Methods of Ventilati

For an essay on "The Ventilation Court," a silver medal will be awar Worshipful Company of Fan Ma advertisement this week.)

Leeds Library.

Designs are invited for a library to at the Compton-road estate. Mr. Worthington, F.R.I.B.A., is the premiums of £35, £20, and £15. from the Town Clerk, Leeds. Sen February 16, 1925.)

Argentina.

The Argentine Government offer 10,000, 6,000, 4,000, 3,000 and 2,000 gold pesos for the best architectural a National Institute for the Blind particulars are available in the Enq at the Department of Overseas Tra Queen-street, S.W.1. NORTHERN POLYTECHNIC

PRESERVATION OF ANCIENT MONUMENTS

On October 27 Sir Frank Baines, C.V.O., C.B.E., gave a paper at the Northern Polytechnic Department of Architecture, Surveying, and Building, on "The Preservation of Ancient Monuments and Historic Buildings." The lecturer opened an interesting lecture by a reference to the provisions of the Ancient Monuments Act, explaining the duties and responsibilities which it imposed upon private owners and upon the Government in respect of buildings scheduled as ancient monuments. He referred to the extraordinary historic interest and importance of many of these buildings, and indicated the necessity for preservation from many points of view. He then showed a series of slides of various buildings, indicating the condition of the masonry and walls when transferred from private ownership to the custody of H.M. Office of Works. The lecturer showed the serious disintegration and damage caused by the extensive growth of ivy, trees, and other herbage, as well as the damage caused by time and the use of these buildings as quarries for the erection of surrounding houses and other structures.

Passing to the consideration of individual buildings, reference was first made to Tintern, one of the great Cistercian abbeys. (See *The Builder*, August 18, 1922.) The date of the existing work is generally that of the end of the thirteenth century, when the present church was built to the south-east of the older church. The most serious difficulty which the preservation of this abbey presented was the support to the south arcade wall, which was 68 ft. high, 5 ft. 6 in. thick at the top, and unsupported. This wall was out of plumb and bowed in the centre; the eccentric loading of the piers thereby created had brought the load per foot super on some of the masonry to a dangerous point, and some of the piers were actually failing by crushing, and in order to reduce this load without resorting to the use of unsightly and obstructive buttresses, a horizontal steel girder of N type was designed which was anchored down at the ends into the wall of the south transept, and to the wall of the west gable, and connected to the south arcade wall over the centre of the piers. Connecting bolts were employed to reduce the overhang—an operation which was carried out in four stages, separated by intervals of one month, stress recorders being fixed at a number of points. By this means the load on the piers was reduced, the masonry was rendered safe, and Tintern was preserved for all time as nearly as possible in the condition in which it was handed over. A view was shown of some of the tracery which had been repaired by means of copper bands, which will keep it in position indefinitely and prevent further destruction.

From Tintern the lecturer passed to Rievaulx, which is the earliest Cistercian house in the country, dating from 1131. Rievaulx came under the jurisdiction of the Government in an extremely difficult, almost disheartening, condition. Much of the plan of the abbey was invisible owing to the mass of debris which was piled up over the top of the pier stumps and pavement. This debris was removed and the plan exposed to view. The masonry was repaired to the extent demanded by the needs of preservation, and views were shown of the abbey in its present condition.

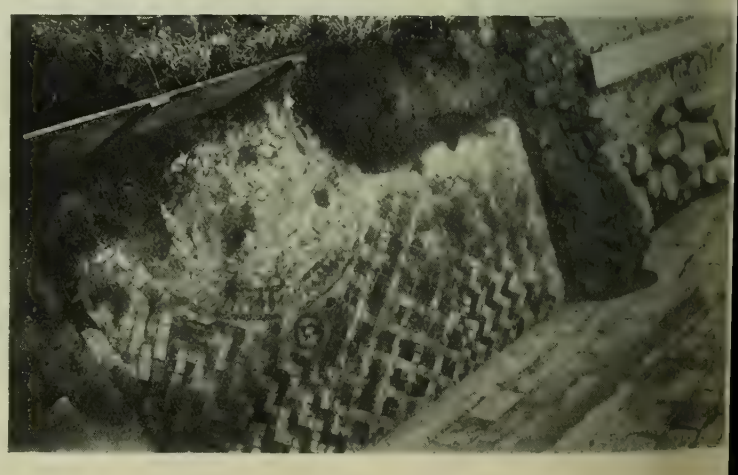
The next view was of Carnarvon Castle, one of the most, if not the most, magnificent mediæval castles in existence. It was commenced by Edward I (its date is 1285-1322) to guard the Menai Straits and as a means of overawing the Welsh people. Built as a purely defensive structure, it has remarkable architectural attributes. Its massive walls of coloured stone, its fine outline, and beautiful proportions mark it as an architectural achievement of the highest interest and importance. Views were shown of, and particular reference was made to, Queen Eleanor's Gate and the Eagle Tower.

Whitby Abbey next claimed attention. (See *The Builder*, March 28, 1924.) This abbey was founded in A.D. 657, but the portion which remains dates from the thirteenth century. This abbey was officially scheduled as a historic building in 1914, and before any attempt at preservation could be made the war broke out and suspended all work on ancient monuments. In 1914 the Germans bombarded Whitby and, incidentally, damaged the abbey, destroying certain portions of the tracery and other masonry at the west end. This damage resulted in further falls of masonry during the ensuing year, so that when, after the war, the lecturer commenced the task of preservation he found the remains in a far worse condition than at the time of handing over. This incident of the German bombardment resulted in a departure from the normal policy of the Ancient Monuments Department. Its almost invariable policy is to avoid restoration or reconstruction and to concentrate only upon preservation, but in view of the "accidental" character of a large amount of the damage at Whitby it was decided that in the case of Whitby some of the damaged masonry should be replaced, save only that where new work must be added for purely constructive reasons this new work should be clearly indicated. In the case of Whitby, therefore, a combined scheme of restoration and preservation was carried out, and the abbey is visible to-day practically as it was in the early part of 1914, except that it is now rendered safe from further depredations by the weather or other forces. In addition to this work at the west end, certain excavations were carried out which exposed the plan and the remains of some of the walls and piers.

Kirby Muxloe Castle, an old fortified manor house of Tudor times, dates from 1480, and was another of the monuments which had fallen into such extensive disrepair that it had almost ceased to have architectural interest. The moat was re-excavated, a bridge was constructed on the site of the original drawbridge, and some of the old piles were exposed and now remain standing in their original positions.

Views of Byland Abbey, another of the historic churches, were thrown upon the screen. This abbey is remarkable for its fine carving and ornament which would be difficult to rival. In the floor of the abbey was found the remains of a fine coloured tile pavement of excellent design and colour.

The condition of Goodrich Castle w worse than that of other cases me and after instructions had been given mence work upon the north-west curta a collapse occurred whereby hundreds of masonry were dislodged. It probable that if this collapse had occ month later when scaffolding had been it might have involved serious injury of life to the workmen. The remain tion of the wall was, however, shored repaired; the overgrowing vegetati cleared away, and Goodrich was n manently preserved and was able to with some indication of its ancient gl



At Netley Abbey another of the problems of isolated walls was enco In this case it was necessary to fin means of stiffening the top of the such a way that it would resist wi sure and the normal disintegration t it was subjected by ordinary weath ditions. To this end a reinforced beam was built into the wallhead, pi down to the more solid masonry at treme end. A detailed view of one p shown, and the process "coring" e in detail.

Hampton Court Palace next claime tion, being shown first by means of a view from the air, and next by detaile of the woodwork of the hall roof. turer commented upon the fact that the carving was apparently carried the ordinary workmen engaged on th and that this carving was considered task which they could accomplish the aid of specialists or carvers. Som were shown of the Westminster Ha with an indication of the destruction by the beetle Xestobium Tessellatum lecturer referred to the almost unbe destruction which this small grub had and gave some views of the grub its of the beetle which eventually evolve

A general view was shown of Ri Castle, one of the great Yorkshire holds, and views were given of Stor with some interesting details condition of the stones of the inner ci evidence of the existence of an out of a much earlier date.

The lecturer concluded his lecture view of Maiden Castle, showing a fosse constructed with immense lal men of the Stone Age, a fosse which and importance has no equal in ar part of the country. In this case able destruction had been brought a rabbits, a pest now kept within bo constant ferreting.

Mr. T. P. Bennett proposed a hea of thanks, which was carried with tion. Owing to the lateness of the discussion followed.

Byland Abbey; Part of Pavement exposed during excavation.

ARCHITECTURAL SOCIETIES

R.I.B.A.

take the following notes from the es of the Council meeting held on nber 3:—

hitecture and Craftsmanship.—The fol- recommendations passed by the Art ing Committee were approved by the il: (1) That an additional committee be d, the purpose of which shall be to the best interests of the crafts con- with the construction, decoration, and nent of buildings. (2) That the Allied ies be invited to form local committees a similar object in their districts. (3) one evening in each institute session be d to the reading of papers and discus- n subjects relating to craftsmanship. hat short lectures of a popular kind be ed for from time to time at Conduit- and locally by Allied Societies. (5) he Board of Architectural Education be l to consider whether more can suitably ne to assist the understanding of craft ses and the right use of material in ucation of students.

ibald Dawnay Scholarships.—On the nendation of the Board of Architectural tion the following awards were made: Turner (Liverpool), £50 scholarship; Cameron (A.A.), £25 scholarship; Burnett (Leeds), I. R. Erith (A.A.), C. Todd (Liverpool), grants of £20

B.A. Scholarships at the School of cture, Cambridge.—The scholarships warded as follows: First year, Miss Aiton, Girton (£35); second year, dward Le Bas, Pembroke (£35).

ds and Committees.—The following ap- ents were made: L. Sylvester Sullivan, of Architectural Education; George le, Board of Architectural Education; Sadgrove, Royal Gold Medal Com- L. H. Bucknell, Competitions Com- T. Taliesin Rees, Housing Com-

tration.—The following were invited ve on the Registration Committee: Harry Barnes, Arthur Keen, G. C. ice, Percy Thomas, W. Gillbee Scott, Alan Slater (R.I.B.A.); A. J. Taylor, . Sheffield, C. F. Skipper, L. Sylvester n, E. J. Partridge, and Thomas (Society of Architects). The Com- was given power to appoint, at their scretion, a number of advisory mem- representatives of the Allied Societies other bodies and interests affected.

ed Overcrowding of the Profession.— llowing members were appointed to n a joint committee (with representa- f the Architects' and Surveyors' As- Professional Union) to inquire into ged overcrowding of the profession: Keen, Maurice E. Webb, and Francis

s in Offices.—On the recommendation Board of Architectural Education the decided to recommend Members and tes of the Royal Institute not to upils until they have been registered ationers R.I.B.A.

ESSEX SOCIETY OF ARCHITECTS.

time ago the Bristol Society of Archi- nd the Gloucestershire Architectural ion amalgamated and formed the Society of Architects. The inaugural n of this new body was held at the dge, Bristol, recently, the President, . Lawrence, F.R.I.B.A., in the chair. . J. Taylor, F.S.A., President of the of Architects, in proposing "The Royal e of British Architects," said that for rty years the profession had been d and governed by two Societies which n working on different lines, and had ays seen eye to eye. He thought that een proved that the ideals and aims of both bodies were identical, and that it only required their coming closer together and knowing one another better to realise that. With regard to his own Society, they had had definite objects in view which had not been in the forefront of the Institute programme, but he was hoping now that they would go forward with but one object in view.

Mr. Arthur Keen, F.R.I.B.A. (Hon. Secretary of the R.I.B.A.), said, in response, that he had no doubt the New Wessex Society had a career of great usefulness before it, and he wished it the utmost prosperity. The Institute, which had been going on for 100 years, was originally a learned Society. It had become a great professional Society, but it had not ceased to be a learned Society; the matter of education occupied the greatest share of its activities. It had been helped and supported most vigorously by the provincial Societies. As time went on he thought that the provincial Societies would link themselves up with larger bodies, but they would still recognise the value of the Institute to them, as the Institute recognised their value to itself. The test of the usefulness of the Associations was the test of service. They wanted to see a better standard of work throughout the country. If they could go back one hundred years and see this country they would find no vulgarity; all the vulgarity in building work had arisen in that period. They must all set themselves to correct it, and it was only to be done by way of education. He believed they were doing very well in Bristol with the new school they had started, and he thought there was little hope without the help of such schools.

Mr. Ian MacAlister (Secretary, R.I.B.A.), who also responded, said the overseas associations were making it into a very big Imperial organisation, and for that development they had to thank the allied Societies.

Mr. W. S. Skinner, F.R.I.B.A., President of the Bristol Society of Architects, in proposing "Our Guests," coupled with the toast the name of Canon J. O. Hannay.

Mr. G. P. Milnes, President, Gloucestershire Architectural Association, in support, said he was sure Gloucestershire members appreciated the amalgamation, which would extend over the whole of Wessex, and would be for the good of all.

Canon Hannay, responding, said that he had found people in the West of England as courteous as his Irish friends, and as ready to welcome the stranger who came amongst them.

Major Harry Barnes, F.R.I.B.A. (Vice-President of the Institute), proposed "The Wessex Society of Architects." He thought that we should never express ourselves as a people completely in any way until we had once more reached that variety and unity which would come when the great, distinct provincial areas were fully alive to take an active part in all the varied activities of the civilisation in which we lived. Those living in Wessex had probably escaped, to a large extent, the vulgarity mentioned by a previous speaker compared to other parts of the country. Regarding housing, he was afraid there would be great atrocities in some places, but so far as they could influence public feeling he hoped they would influence it against allowing lovely villages and towns to be devastated by hundreds of buildings which had nothing to commend them beyond the fact that they gave shelter.

Mr. P. E. Thomas, F.R.I.B.A. (President of the South Wales Institute of Architects), conveyed the best wishes of that Society for the prosperity of the Wessex Society.

In response, the President (Mr. Lawrence) compared the amalgamated Societies to a bride and bridegroom, and said the union was a very happy one. Following the example of the Institute, the Society had determined to put service first. They existed first to serve the art of architecture, next to serve the public, then to serve the future generation of architects, and, last of all, to serve themselves.

Mr. G. C. Lawrence, the President, occupied the chair at the first session, which was held the same evening at the Royal West of England Academy, when Canon Hannay (George A. Birmingham) gave a lecture on "Emotions in Stone," saying that they all knew how buildings gave them certain emotions. After touching on his visits to famous buildings on the Continent, Canon Hannay said if they thought of the old English parish churches, of the generations after generations of people worshipping there, carrying their sorrows and other human emotions there, did they think that all those waves of emotion surging on the walls and arches of the church had left no mark behind?

Was the spirit of a building, house, church, or anything, due more to the people who used it than the architect or builder who built it? They might think that a fantastic theory, but was such a theory true?

GOTHIC CATHEDRALS.

At a recent meeting of the Vesey Club held at the Council House, Sutton Coldfield, Mr. G. Salway Nicol, F.R.I.B.A., delivered a lecture on "The Great Gothic Cathedrals." It was probable, he said, that no one could completely realise the true significance of the largest of the mediæval churches and appreciate all they could teach of a very important chapter in the history of civilisation. They were, perhaps, a more exact embodiment of the aims and aspirations of their builders than the buildings of any other age. Their production was the enthusiastic concern of the greater part of the intellectual life of their time. To-day, six or seven centuries after their construction, they held perhaps the highest place among all their most valuable possessions. They were a distinct embodiment of a new conception of life, of its beauties, its responsibilities, its joys, and its capacity to receive and propagate divine inspiration. In their day they admired them, but they had only recently learned to treat them with respect and care. They appealed to them mostly on account of their age, the accident of their colouring due to the weathering of their stones, and on account of the very happy subjects they made for the pencil, brush, and the camera. To understand them completely they must by study reconstruct them in their minds as they were in their prime, and picture them with their furniture and fittings restored, their statues replaced, their windows glazed with the original glass, their gold and silver vessels in use, with their vestments, tapestries, and paintings undimmed. Thus they could be made to live again, and their casual interest became a wonder and delight.

During the Dark Ages the lamp of civilisation had almost gone out in Europe, and only in such cities as Byzantium were the Roman traditions continued and developed. It was not until after men realised that the last day was not necessarily near at hand that they threw off their lethargy and, laying aside their contemplative inaction, started progress again with feverish and enthusiastic diligence. Of this rebirth the Gothic cathedrals were the most important expression. Starting with little knowledge of the Roman and Eastern traditions, their forefathers developed new ones for themselves, and in a very few centuries built up a civilisation, and contributed to history one of its most glorious pages. In addition to providing a setting for elaborate services, these cathedrals became a centre for the display of craftsmanship of all kinds, and a distinguishing feature of the time was the honour and respect in which skilled craftsmanship was held. A mediæval city, in addition to its organisation for defence, was the centre of a craft university, and the various guilds of skilled workers were among the most important of its organisations. Gothic art, unrestrained by the classic and Renaissance traditions they now enjoyed, was developed by free and daring experiment. It was an expression of great vital force, full of reasonableness and gaiety. Although its aim and achievement was very different from that of their own time, its vitality and glorious attainment should be a source of inspiration to all of them.

A PROBLEM OF CHRONOLOGY IN STONE: FARLEY CHURCH, SURREY

By H. V. MOLESWORTH ROBERTS (assisted by A. C. BAWTREE).

ONE of the most interesting and well-preserved antiquities in eastern Surrey is the parish church of Farley, between Warlingham (near Purley) and the Kent border. It is best approached from Whyteleafe Station or the adjacent point on the Caterham-road, from which it is about three miles' walk, passing close to the parish church of Warlingham. The church, over 550 ft. over sea-level, lies eastward of Farley village, the rectory being situated between the two.

The isolated position of this sacred little structure, shrouded in trees and boasting no neighbour but a sleepy old-world farm, enhances the peacefulness and sanctity inherent in the church itself, and one's impressions on approaching it are one almost of awe and a readiness to live for a time in the distant age when it was first erected by the devotional labour of willing hands. The interior, especially when redeemed by the beauty and fragrance of Easter flowers, possesses something of that quietude and restfulness common to our village shrines and intensified by one's sense of the ancient date of the fabric, despite the modern chancel arch and fittings which harmonise as well as can be expected with the structure.

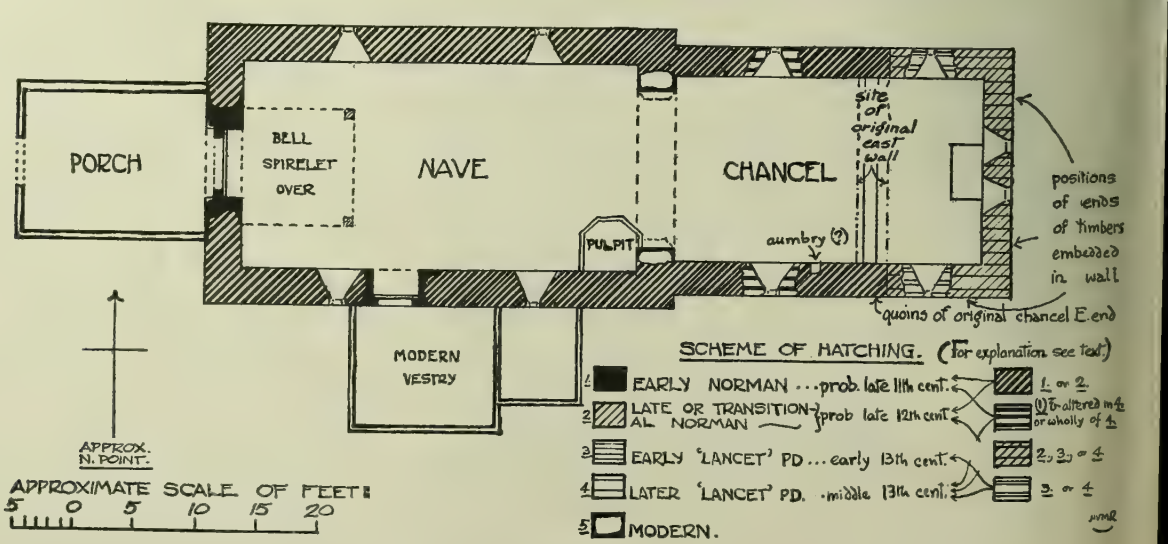
The plan is one of the simplest mediæval types, with western porch and unaisled nave and chancel, and the building is unusual in that it does not show insertions of obviously different periods, as in most churches, but has maintained a similarity of treatment throughout. Except for the modern chancel arch, vestry and some restoration of the stonework of the openings, it has remained practically untouched since the date when the nave and chancel were completed.

The most noticeable feature of the exterior is its general bareness; the windows are small and few and the intervening spaces are covered by irregular rough-casting, comprising patches of hard cement, possibly of Georgian date (now moss-grown), and retaining the thick yellow mortar-coat proclaimed by Mr. P. Mainwaring Johnston to be of mediæval date, and therefore priceless in these days of restoration and plaster stripping—indeed, Mr. Johnston is said to have once been instrumental in saving it from such a fate. The small stretcher-and-header quoins are ancient, and the absence of buttresses, string-courses, or other external features gives a primitive character to the little structure.

The wall is of great thickness (about 3 ft.), and the windows deeply splayed; there is one over the west door, two on each side of the nave, and two likewise in each flank wall of the chancel; there are also two in the east wall, with an intervening pier immediately over the altar—an unusual arrangement.

These openings furnish a unique example of the process of the diagnosis of date of mediæval structures. To take first the exterior, starting with the western end: The western doorway into the nave (see sketch) is typically Norman. The tympanum, incidentally, is without a supporting lintel. The capital of the monolithic nook-shaft has a plain square chamfered abacus (without quirk), and is of a rudimentary cubiform or cushion type. This suggests an early Norman date; the door may well be of the early twelfth or even late eleventh century, so primitive is its structure—a view confirmed by reference to the Victoria County History, which favours the earlier date, by comparison with other churches in the county. The alternative must, however, be kept in view—that the door may have been erected in the twelfth century, and the style may have been a mere survival of tradition quite possible in this remote rural district.

The nave windows are high, but proportionately narrow (originally 9 in. wide), and are round-headed both outside and in; they may date from any part of the Norman period (i.e., from late eleventh to late twelfth century), possibly from the earlier part, like the west door; their fairly tall proportions, however, perhaps indicate the Transitional Norman period, say 1150–90, particularly as they resemble the early Gothic windows of the eastern part of the chancel. The proportions of the nave windows, however, though suggestive of Transitional Norman, are no criterion and can be explained on the grounds that all Norman windows in some localities were fairly tall, but only markedly so in the later Norman period (*e.g.*, Brinkburn Priory; lady chapel, St. Michael, St. Albans) and onward. At the beginning of that period similar proportions existed, but were obscured by the relative smallness of the windows (*e.g.*, original west windows, St. Stephen, St. Albans), whereas these nave windows at Farley, being larger, are of the more developed and apparently later type. The internal "barrel" rere-arch, semicircular on the inside, as well as on the glass plane, precludes the Gothic date, which might be inferred from the suggestion of a point in the external heads of the openings.



The chancel must be carefully studied. On its north side the exterior betray of a break in the continuity of its the masonry being completely maske rough-casting. High up on the so however, several stones are laid ba eastern edges are vertically continuo are quoin-stones, formerly marking of the structure, and indicating the p the east end of the original chancel, t which was so square as almost to Saxon tradition. The present chan porates an eastward extension later.

The western window on each sid chancel differs in having a slight po arch, shown more definitely internal the scoinson is of pointed segmental Gothic date must therefore be as these windows, which, therefore, date end of the twelfth or beginning of the t century—the pointed arch having bee by the local masons, we must suppo dawn of the Gothic period. These ope however, of somewhat similar prop the nave windows, which they rese ternally, and may well be of the same period, the heads being altered at mentioned.

The eastern windows of the north a walls of the chancel belong to the later and are therefore subsequent to th of the western part. They are very simi western ones, and also have definitely heads outside and in; the proportions, are even slenderer, being slightly as well as higher. They are therefo nisable as "lancet lights" of the early thirteenth century (pure "Early style). The two east windows over are less easy to diagnose. They bo pointed segmental scoinsons, but w northern opening is round, the so pointed—a difference which has, ap been reversed in the restored heads e perhaps by a mistake of the repairin These openings may date from the Tr Norman period, the point, if so, bein of optional trick of technique; this m the heads would have been altered in the early thirteenth century, and th windows to north and south also in this date.

Now that the individual features b diagnosed on their own merits and in ship to their immediate neighbours, clusions to be deduced as to the act of the whole must be considered.

The dating of the different part church, as of so many of our ancient s cannot be determined with certain though certain probabilities can (as indicated, yet it is desirable to sch alternative hypotheses, which must the discretion of scholars, in the ho while that documentary or structural will be forthcoming to establish th

nd doubt. Meanwhile, such a consistent rsis, even though not strictly necessitated is particular example, where the ruling of Victoria County History is authoritative probably beyond question, serves as a l for the scientific working out of the ological order of growth in the case of churches, especially where an authoritative ment has not been published.

e system of hatching employed in the plan in which appearance and suitability to the idual building are to some extent sacrificed system which is conceived on a uniform applicable to any church. It, moreover, rs as far as possible the text of this article, does not merely indicate the probable of each part, but, where necessary, aims vering the range of probable dates by ining the types of hatching indicating espective periods, or (as in one case) this ination indicates construction in the first l and alteration in the next. As a basis, n of hatching is adopted for each single l, e.g., solid black for Early Norman, al hatching for Late or Transitional an, and so on; and these are combined tably as possible, e.g., the nave walls are ted in the text to either the early or late an period—therefore, on the plan, solid is combined with diagonal hatching as a version of the latter. It is believed that heme, though at first sight complex, will ially aid the reader in grasping as a whole potheses set forth in the text.

eral alternative hypotheses, then, may be d and compared in the case of both nave hancel. To take the former first :—

whole of the nave must evidently have built at the same time—originally, at any By the foregoing analysis it has been ted that the west door is probably Early un, assuming first that the nave windows ave been Transitional Norman in style; is unlikely that (1) the whole nave was re- leaving the west door intact—the common of diagnosis, in which the date is deter- by the *later* features, and the earlier ones ed as survivals in rebuilding; it is also y (2) that the windows were enlarged in ansitional Norman period; (3) it must, er, be remembered that building some- proceeded slowly and intermittently, and raditions changed with corresponding y; it must be allowed therefore as a lity that the work was begun in the late h century with the west door and lower and that the walls were gradually raised the following century, the level of the s being raised by the later part of the . This, however, is unlikely, as the church would be needed for worship from it, and some kind of structure would be quickly, however gradual the subsequent ements. (4) For a similar reason one suppose that the west door or wall was nd left isolated for a few generation the structure was completed. (5) It is probable, therefore, that the windows, despite their size, are no later than the door and the nave as a whole dates from the early eleventh century. This view is adopted by the Victoria County History. This hypothesis, however, does not explain the close resemblance between the nave and chancel windows; and if the latter are really Gothic the similarity of the former must therefore be ascribed to the simplicity and crudity still obtaining in local workmanship in the later period, and to the well-known principle of "assimilation," by which additions to a structure were designed, purposely in harmony with the existing fabric, as in the naves of Westminster, St. Albans, and elsewhere. This line of argument regarding the nave constitutes an example of the type of building where good reason exists for dating the whole structure by the *oldest* existing part.

The chancel, however, needs separate diagnosis. (1) The early Norman date that is most conclusively assigned to the nave applies equally to the original (western part of the existing) chancel, as the church must have had a chancel from the very first; this view is adopted in the Victoria County History. Judging from their proportions, the windows may date from the same period, their heads being subsequently Gothicised. This view explains the similarity between the nave and chancel (despite the apparent hiatus in point of time) by ascribing a part to each and thus acting as a link. This will therefore leave us free to call the rest of the chancel Gothic, and to assign to it (as does the Victoria County History) a date approaching the middle of the thirteenth century—probably when Merton College, Oxford, took over the estate. (2) Or, adopting otherwise the above line of argument, we may follow the Victoria County History in ascribing the western chancel windows

WEST DOORWAY FARLEY

to about 1220—i.e., rather earlier than the more characteristic "lancets" of the eastern chancel, and approximating more closely to the nave type, but not otherwise explaining the similarity of tradition. (3) If, however, the nave is "Transitional Norman," the whole of the chancel may also have been constructed in that period, especially as the twin east windows closely resemble the rest of the fabric and that one of them is round and the other pointed—usually a sign of gradually-changing tradition. The eastern extension of the chancel, though made subsequently, does not necessarily indicate a distinct period of growth, but may have been carried out only a few years after the earlier portion, which perhaps was only a makeshift for temporary use necessitated by lack of funds—so the squareness of the plan would seem to suggest. The heads of all the six chancel windows would, on this process of reasoning, have been altered subsequently internally. This hypothesis is, however, on the whole, unlikely.

Independently, however, of the problems of chronology which it offers, this little church is full of interest and repays a careful and reverent inspection. The western porch, of half-timbered work resting on a stone plinth, is modern in its present form, but is of fifteenth-century type, and incorporates some ancient oak timbers which appear to hail from an earlier structure. The timber belfry is lightly built, with an open bell stage and squat pyramidal spire, and may follow an earlier type in its design, as at Wilcote Church, Oxfordshire.

A Norman doorway in the south wall of the nave, of still simpler type than the western entrance and now opening into a modern vestry, consists of a deep semi-circular archway and a lintel behind, a little above the springing level. It is unusual to have a south external doorway in addition to a contemporary western one, but there appears to be no sign of any southern apartment into which it might once have opened, and a chapel, at any rate, would be out of place so near the western end.

The chancel arch, lancet-arch in form, is modern, like the conical corbels and jambs on which it abuts. On the south side of the chancel, near its east end, is a small square recess which once served possibly as a credence or aumbry, since no trace is visible of any sinking or "dish" suggestive of a piscina, though it occupies the typical position of this feature in relation to the altar of the original chancel. Two ancient grave slabs (one bearing small early brasses of 1495) are now stood upright by the walls—an ingenious manner of preservation which, while protecting them from further wear, makes them clearly visible and easily inspected by the observer, though violating the original posture of the figure as pourtrayed, and presenting a great difficulty to the rubber of brasses.

[Indebtedness is expressed to the Victoria County History of Surrey and others, consulted subsequently to the original survey embodied in this article.]

THE ARCHITECTURAL ASSOCIATION

MR. H. S. GOODHART-RENDEL (President) occupied the chair at a general meeting of the Architectural Association held at 35, Bedford-square, W.C., on Monday evening.

New Members.

The President announced that there were two nominations for membership, and the following new members were elected :—

W. E. Aitken.
E. H. Loye.
W. H. Eales.
W. S. H. Pawson.
L. G. Pearson.
Miss P. M. H. Bush.
Miss M. F. Pepler.
A. A. V. Campbell.
T. W. Snailum.
F. J. A. Schupback.
J. W. Parr.
W. E. Lowes.
Miss P. L. Bateson.
Miss K. A. Veitch.
A. G. Raven.
G. R. Dawbarn.
E. Playne.
Miss R. D. Morrison.
H. S. M. Carver.
B. S. Hume.
Miss J. H. Read.
R. B. J. Selby.
G. C. Ames.
H. R. Easton.
Miss M. A. M. Hodson.
R. S. Lavers.
G. F. Nicolls.
A. H. Girard.
F. C. G. Grant.
C. D. Hill.
J. A. Ritchie.
S. J. Kemp.
Miss A. C. H. Brinton.
N. B. Hillier.
H. W. Rich.
C. W. B. Ferguson.
O. H. B. Bedford.
D. R. Burles.
J. C. Rose.
J. M. Richards.
J. C. Dickson.
C. A. C. Turner.
G. F. Randall.
E. B. G. Boulton.
H. Hulse.
H. M. Peskett.
E. Mader.
M. A. Halim.
Miss M. J. Tyrwhitt.
S. L. Thomson.
Miss D. F. Buckland.
W. A. K. Faldo.
S. E. Dykes Bower.
F. E. B. MacManus.
H. Greenwood.
W. H. M. Penn.
E. A. Rowse.
T. Ritchie.
F. R. Jarman.
K. E. F. Gardiner.
J. D. Beloe.
H. R. Thompson.
A. E. Westerman.
R. F. McQuistan.
Miss M. H. Sullivan.
R. P. Cummings.
G. N. Lewis.
Claude Flight.
C. H. Reilly.

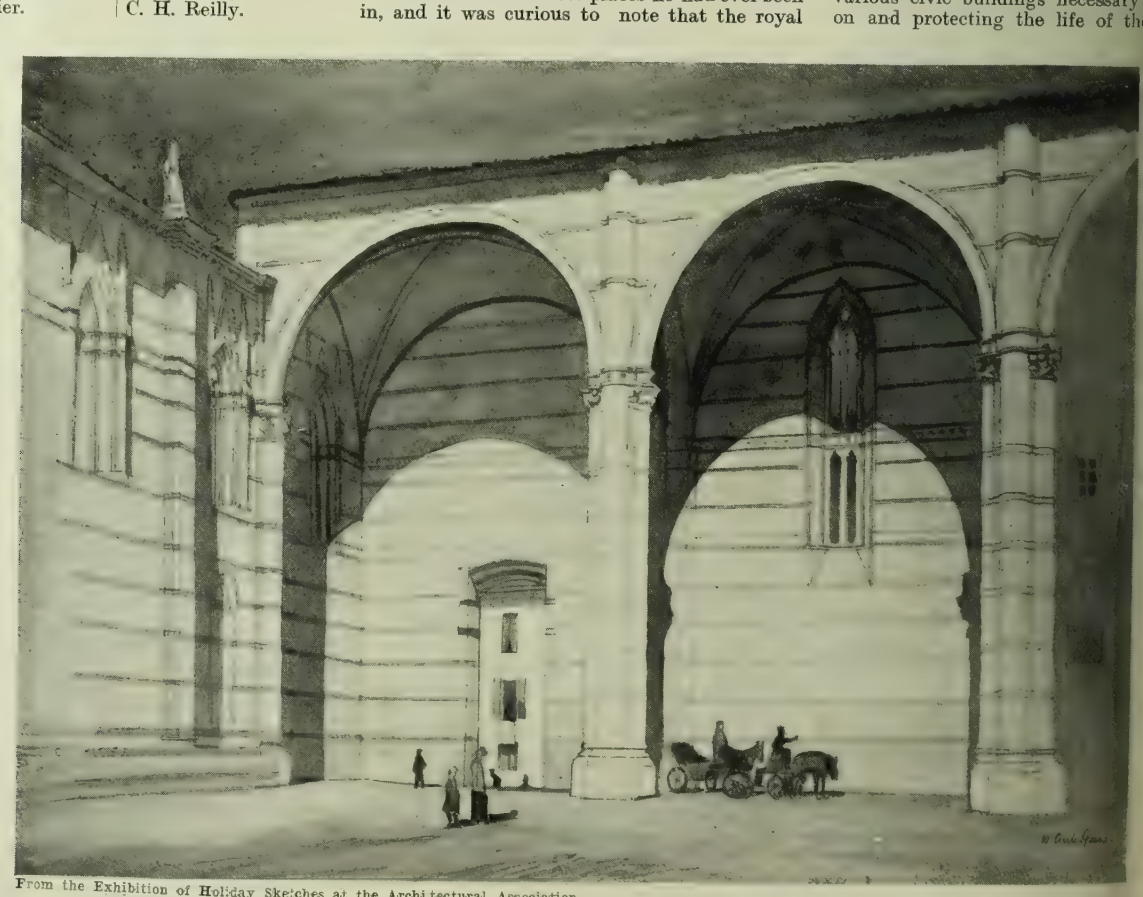
Mr. P. M. Fraser was reinstated to membership.

MR. SYLVESTER SULLIVAN read the auditors' report on the accounts of the Association for the past half-year, which was received.

It was announced that the A.A. Students' Pantomime is this year to take place on December 17, 18, 19 and 20, at the premises of the Royal Institute of British Architects, Conduit-street, W.1.

The Excursion to Spain.

MR. E. J. T. LUTYENS then addressed the meeting on "The A.A. Excursion to Spain, 1924," first pointing out that his intention was not so much to speak about the places visited as to show some of the large series of photographs taken by Mr. F. R. Yerbury during the tour. In the course of his remarks Mr. Lutyens gave some idea of the strenuous time the party spent in covering so much ground in the short period of seventeen days, and of the large number of interesting buildings which they saw. The party made their headquarters first at Madrid, and after seeing that city explored other towns in the neighbourhood, allocating a day to each trip. The lecturer also mentioned the excellent reception the party everywhere received; in most towns a civic reception was accorded to them, and in one town they were welcomed by the Mayor on arrival as early as six o'clock in the morning. Some of the party also had the honour to be received by H.M. the King of Spain, who personally conducted them round the palace and outlined the history of the tapestries and other interesting features. Those who took part in the tour were also fortunate in the arrangements made by Mr. Yerbury for local Spanish architects to meet the party at different towns, thus ensuring that the time at their disposal was spent to the best advantage.



In proposing a vote of thanks to the lecturer, MR. STANLEY HAMP said this year's tour must have been one of the most pleasurable trips organised by the Association. Spain was a delightful country to visit. He found Madrid to be one of the noisiest places he had ever been in, and it was curious to note that the royal palace was right up against the railway so that everyone entering the city had to circle round the palace after leaving the station. He had also visited Barcelona, which had much freakish architecture. Apart from the freakish buildings, however, a great cathedral was now being built in Barcelona, the enclosing walls were being built first. He was extraordinary to think that such a cathedral was being built at the present day with only twenty men working on it.

The vote of thanks was seconded by J. M. EASTON.

MR. F. R. YERBURY said he would like to say how much he appreciated all that had been said with regard to the organisation of the excursion, but he would also like to point out that the good work of the staff of the Association, especially his assistant, Mr. A. alone made it possible.

PALACES OF MEDIA ITALY

SIR BANISTER FLETCHER, F.R.I.B.A. gave a lecture recently at the Central School of Arts and Crafts on the secular architecture of Mediæval Italy—bridges, palaces, town halls, hospitals, and other public buildings. He noticeable, he said, that few civic buildings existed which were erected earlier than the twelfth century, for the early warfare at the destruction of fortified and civic buildings, while regarding churches as The most interesting aspect of secular building activities of this period was the power gave of the rise and growth of municipalities and the development of the communal idea. Their conscious power was exercised not only in their dealings with irrepressible nobles and in the erection of great cathedrals, but also in all departments of life and in providing on a grand scale various civic buildings necessary for the on and protecting the life of the town

LLUSTRATIONS

New Office Building.

e premises, now being completed at Broadway, Westminster, S.W. 1, opposite nes's Park Underground station on the t Railway, comprise basement, ground nd eight floors over, having a total floor f about 80,000 ft. super. The structure l-framed, and the front elevation has arried out in stone. The frontage to ay is about 92 ft., while the depth of extends to the southern boundary of y in Queen Anne's-gate.

ohn Warton is acting as clerk of works, general contractors are Messrs. Ford & Ltd., of Kilburn. The sub-contractors rman, Long & Co., Ltd., steelwork; nd Portland Stone Firms, Ltd., stone-The Express Lift Co., Ltd., lifts; Young, & Young, heating and hot water; ooper, Ltd., electric light; Haywards, re escape staircases; British Luxfer yndicate, Ltd., metal casements; W. B. & Sons, tiling and terrazzo; F. Brad-Co., fire-resisting staircase; Adamsez, anitary fittings.

rchitect is Mr. H. J. S. Abrams, 19, ham-street, Strand, W.C. 2.

St. Marylebone Housing Scheme.

scheme each block consists of 16 self-l flats approached from two stair nd each flat consists of a living room, scullery, bathroom and w.c. and three s in the larger flats and two bedrooms maller flats. In addition each flat is th coal space and cupboards and pro-made for a constant but limited hot pply. The living room is fitted with ed stove and oven which can be used ; an open fire or a kitchener—the s fitted for use with a gas or electric nd the flats are wired for electric light. the flats have external balconies. out of the balconies on the site has anged so as to obtain the maximum ne in all the living rooms and bed-nd the courtyards assure a plentiful light and air to each and every flat.

nal facilities in the scheme are as -Laundry with washing and drying the tenants' own use, perambulator lation and provision for local coal nned in convenient positions on the rther, a central boiler house provides to each flat, low pressure hot water eing installed with pumps to ensure circulation to each flat.

ildings generally are of fire-resisting construction, brick walls with red facings and the floors of hollow brick tiles with concrete filling, while the roofs are covered with red Caddick tiles. Interest is given to the elevations by the treatment of pilasters, &c., in cream stucco, while the entrances are given some character by being built in artificial stone of a simple design. Internally the flats are finished with solid boarded floors to the living and bedrooms while the sculleries and bathrooms are finished with granolithic with coved skirting. The walls and ceilings are finished with Sirapite plaster finished in grey distemper, and picture rails are provided to the several rooms. Ample cupboard accommodation has been provided and special food cupboards with permanent ventilation have been planned adjoining the sculleries. The staircases are of granolithic with wrought-iron balustrading and oak handrails.

Owing to the difficulty of obtaining vacant possession of the houses already on the site it was not possible to proceed with the scheme as a whole. In January, 1923, tenders were invited for the erection of two blocks containing 32 flats, the central laundry, boiler house, coal and perambulator stores. The tender submitted by Messrs. Walker & Slater, of Uttoxeter Old-road, Derby, for the sum of £26,280 was accepted by the Council. The scheme when completed will make a very effective clearance in a congested area, and will form a substantial contribution towards the provision of improved housing accommodation in this part of the borough.

The principal contractors for the buildings now completing are Messrs. Walker & Slater; while the chief sub-contractors are Messrs. The Concrete Stone Co., artificial stonework; Messrs. F. Bradford, granolithic work; Messrs. J. Jeffreys, central hot-water engineers; Messrs. Edwards & Son, "Worker" grates; Messrs. Gillham & Jones, electrical installation; and the Gas Light & Coke Co., gas installation.

Messrs. H. V. Ashley & Winton Newman, FF.R.I.B.A., whose design was accepted in a limited competition, are the architects.

The Vale House, Chelsea.

This house was designed by Mr. W. K. McDermott, A.R.I.B.A., and, in his absence abroad, the supervision of the execution was undertaken by Messrs. Forsyth & Maule.

The Chenil Galleries.

The drawings we give this week illustrate the new Chenil Galleries now under erection on a site adjoining the Town Hall, Chelsea. This represents the first instalment of an enterprise the object of which is to provide an art centre in this part of London, and includes picture galleries, a restaurant and rooms available for music, dances or receptions, and drawing or painting classes. The galleries occupy a large area in the rear of the building and communicate also with Manor Gardens. For these Galleries various systems of lighting have been adopted to suit the conditions caused by the different heights of the surrounding buildings. The elevation to King's-road is of Portland stone, and the chief problem in the design has been to bring the rather unusual vertical dimensions which result from the special floor level requirements into some relation with those of the block, principally of shops, to which this building will form the eastern termination. The lowness of the ground story, calculated to give direct access to the main-floor level of the Galleries on entering, has called for some modification of the traditional treatment of a basement, and a more gradual transition to the contour above; whilst the second floor, with its wide window spaces, is given a certain loggia-like character by the substitution of eaves for the usual cornice.

Messrs. Perry & Co. (Bow), Ltd., are the general contractors; Messrs. Rosser & Russell the heating engineers; and Messrs. T. Clarke & Co. the electricians. The floors and roof (which is slate-covered) will be by the British Reinforced Concrete Co., and the windows by the Crittall Manufacturing Co. The Bath and Portland Stone Firms, Ltd., supply the Portland stone. Messrs. Kennedy & Nightingale are the architects.

Nurses' Home at St. Bartholomew's Hospital.

We illustrate this week the new Queen Mary's Home for Nurses at St. Bartholomew's Hospital, London, of which Mr. H. Edmund Mathews, F.R.I.B.A., is the architect. The building is of steel-frame construction. The external curtain walls are of brick faced with Portland stone. The building has been planned in four blocks connected by enclosed bridges. Each block and each floor is self-contained, and any block or any floor can be isolated without interfering with the working of the remainder. Provision is made for 557 separate bedrooms.

House at Salcombe, South Devon.

This house is situated on a steep hill looking out to sea across the bar at Salcombe. An old stone quarry has been used to form a garden below. The house is of local stone and stuccoed, with window jambs, sills and mullions of Doulting stone, from Somerset. The roof is of red Delaboles, and the half timber of old oak. The windows are steel casements with leaded lights. Mr. F. Harrild, A.R.I.B.A., is the architect.

MEETINGS

FRIDAY, *November* 28.

Glasgow Architectural Craftsmen's Society.—Mr. J. Falconer on "Woodworking Machinery." At Royal Technical College.

MONDAY, *December* 1.

Institution of Electrical Engineers (Western Branch).—Mr. W. E. Bush on "Modern Illumination." At Cardiff. 6 p.m.

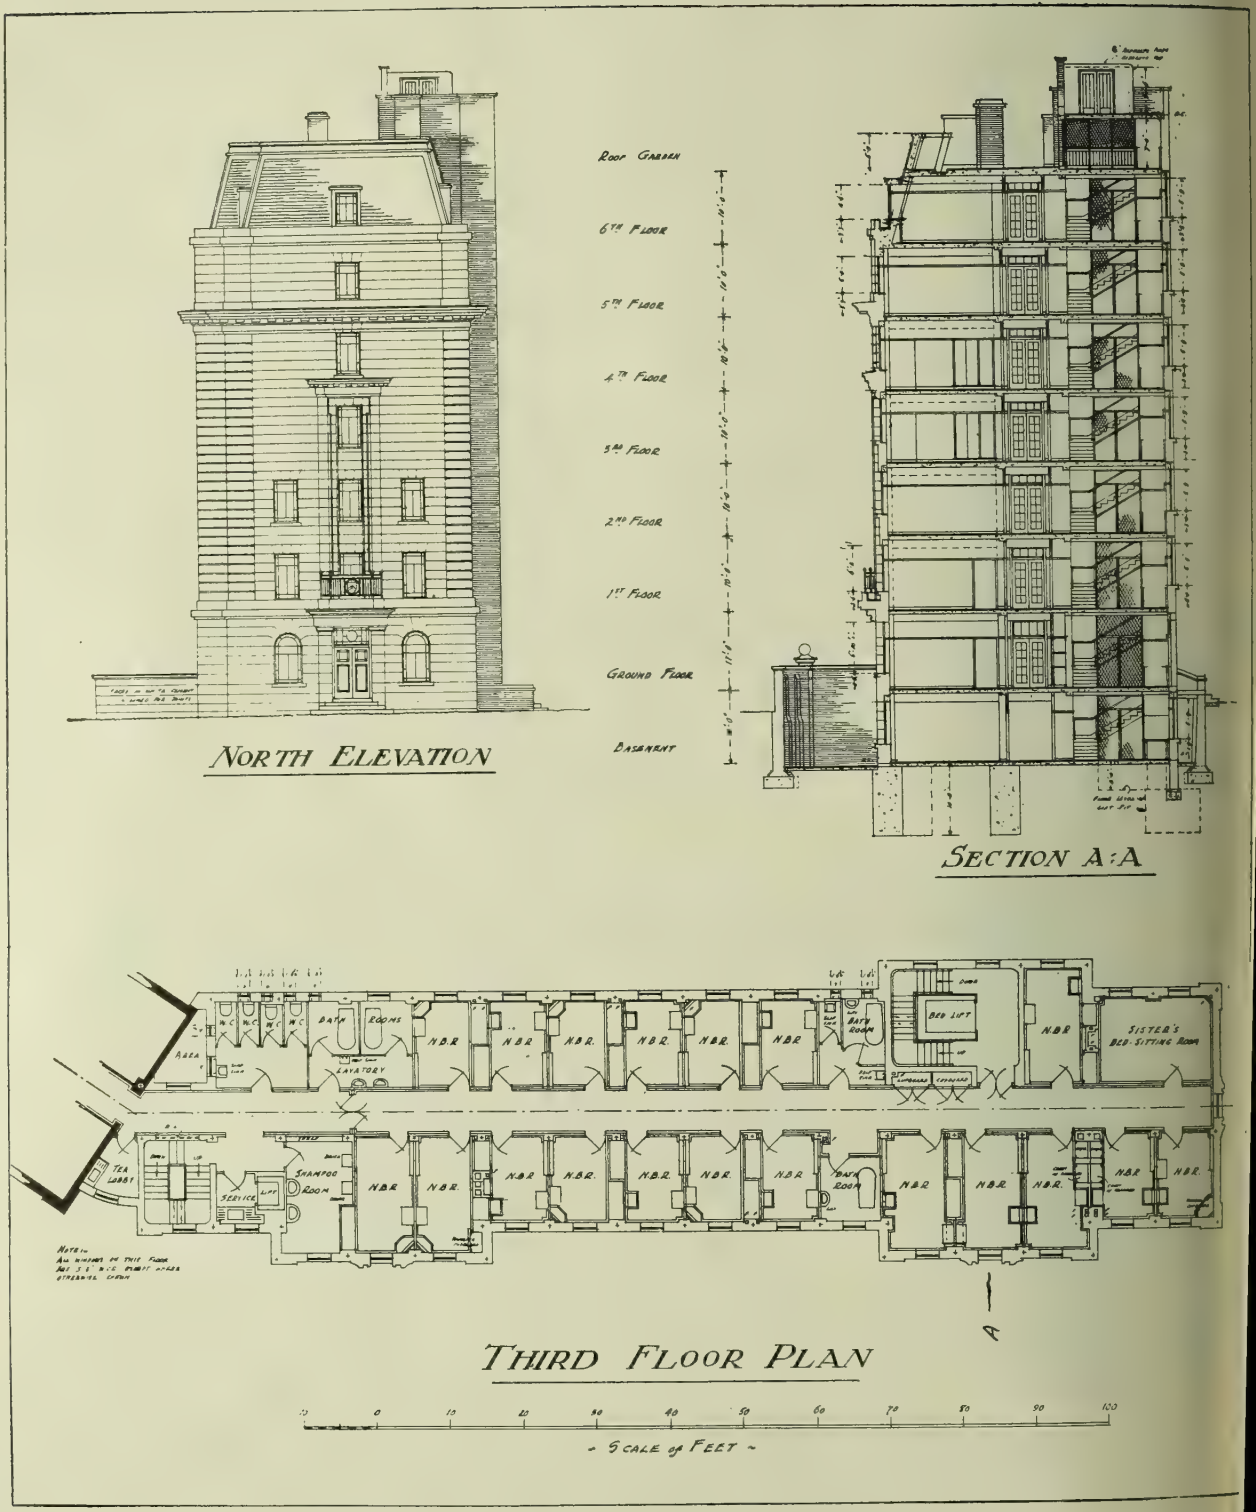
Edinburgh Architectural Association.—Smoking Concert. At St. Vincent House, Great King-street, Edinburgh.

Royal Society of Arts.—Mr. L. C. Martin on "Modern Colour Problems." At John-street, Adelphi. 8 p.m.

TUESDAY, *December* 2.

College of Estate Management.—Mr. E. W. Eason on "Compulsory Acquisition of Land." At Lincoln's Inn Fields, W.C. 5.30 p.m.

WEDNESDAY, *December* 3.



Institution of Sanitary Engineers.—Mr. H. A. Roechling on "House Drainage, with Special Reference to the Intercepting Trap." At Caxton Hall, S.W.1. 7.30 p.m.

THURSDAY, *December* 4.

Auctioneers' and Estate Agents' Institute.—Mr. E. H. Blake on "The Institute, 1886–1924." At 29, Lincoln's Inn Fields, W.C. 7.30 p.m.

Yorkshire Cottage Hospital.

A scheme suggested some seven years ago for the provision of a cottage hospital to serve an important mining area in Yorkshire of about 60,000 to 70,000 population, including and surrounding Castleford and Normanton, has now taken a definite shape, plans and specifications, prepared by Mr. R. A. Easdale, F.R.I.B.A., of Castleford, having been adopted, and a representative committee of employers and employees in the area have accepted the tender of Mr. L. J. Gallagher, builder and contractor, of Castleford, at £26,714 3s. 9d., the building to be of brick with green Westmorland slates. The hospital is to consist of a two-story central administration block with a wing on the "Y" principle at each end, each wing providing two wards with total accommodation for 38 patients, and the building is to be so constructed as to be readily capable of extension when required.

THE ARCHITECTURE CLUB

THE second annual meeting of members of the Architecture Club was held at the Royal Institute of British Architects on November 18, the President, Mr. J. C. Squire, in the chair. In presenting the report of the Executive Committee and statement of accounts for the year ending May 31 last, the chairman stated that, apart from the Club's Exhibition at Grosvenor House in the spring, they had had the pleasure of co-operating with the Royal Institute in organising the representative Exhibition of British Architecture at the British Empire Exhibition and also of assisting the Institute in formulating a protest against the St. Paul's Bridge project. These matters might be taken as evidence of the happy relations that had always subsisted between the Club and the premier body of British architects, by whose courtesy, indeed, they were meeting in that hall. Mr. Squire referred to the visit of Her Majesty the Queen to the Club's Exhibition, to the excellent and stimulating address of the Marquis Curzon at the opening ceremony, and to the thoughtful and sympathetic speech of the ex-Premier, Mr. Ramsay MacDonald, at the last dinner of the Club in May. A considerable part of the report dealt in detail with the work of the Sub-Committees. The financial statement showed that a considerable loss had been sustained through the Exhibition, but the deficit, the chairman explained, had since been cleared off. The report and accounts were unanimously adopted.

Messrs. Arthur J. Davis, Nathaniel Lloyd, Charles Marriott, and Clough Williams-Ellis were elected to fill vacancies on the Executive Committee caused by the retirement, under Rule VII, of Messrs. Oswald Barron, E. Vincent Harris, Ralph Knott, and Professor Hubert Worthington. Votes of thanks to the retiring members of the Executive, the retiring treasurer, Mr. H. Austen Hall, who is succeeded by Mr. Darcy Braddell, also to the R.I.B.A., the chairman and the secretary, concluded the proceedings.

THE ANCIENT WORLD & RECENT EXCAVATIONS

A SERIES of lectures on "The Ancient World and Recent Excavations" was inaugurated recently at the British Museum, when Miss Claire Gaudet gave an address introductory to her course in which she will trace the evolution of architecture from the earliest known times until the Roman period.

Miss Gaudet showed how all arts had their origin in the service of the gods, and that architecture proper began when temples were built for worship, and theatres for the performance of religious rites; the earliest form of the latter being circular, supposed to have originated with the performance on the threshing floors. The exact date of birth and place of origin of architecture could not be stated. Until lately Ur and Ashur were supposed to have been the earliest known cities, but it had now been established that Kish flourished long before these two cities, a complete list of its kings having been found.

For many years the Egyptian civilisation was thought to be the oldest, probably the Egyptian stone was of a par enduring nature, and many evidence culture of Egypt had thus been p whilst those of Babylon and Mesopota perished. However, excavations, begu the recent war had given evidence of a civilisation in the latter countries. Arthur Evans had discovered traces o faring race farther advanced in civilisat the Egyptians, with whom they were t

The traces of civilisations were fou on clay tablets, and on stones contain than one language, such as the Roset discovered in 1798, a part of which ca the possession of the British in 1801, a be seen to-day in the Assyrian Galler British Museum.

Following the Babylonian, Mesop and Egyptian civilisations, they got Crete, then the Mycenian age with its pillar cult. Next came a dark peri which civilisation emerged to the glor of Greek art, coming to its zenith a defeat of the Persians. To this period t the sculptures of Phidias and such w temples as the Parthenon and Erecth Athens.

In conclusion, Miss Gaudet pointed o Roman building was the logical result o tion through the earlier types, and that was based Gothic architecture, which no means a mushroom growth springin a moment, as some people seemed to t

The lectures, twenty in number, ar every Thursday in the British Museum Room, at 4.30 p.m., and also in the Polytechnic on Fridays, at 8 p.m.

BOOK REVIEWS

English Decoration and Furniture of the Early Renaissance (1500–1650). By M. JOURDAIN. (London: B. T. Batsford, Ltd.) £3.

We are in entire agreement with Lieut.-Col. E. F. Strange when he tells us in an interesting "Foreword" that "The period covered by Miss Jourdain in the present volume is, of all others, the most interesting in the history of English Decoration and Furniture; for it was that which saw the laying of the foundation whereupon all subsequent progress has been based." This being so, Miss Jourdain has designedly or by force of circumstances reserved her choicest course to finish the feast. It is Volume I of the series, and it is two years since the same writer gave us Volume IV dealing with the period 1750–1820. Still earlier we had the two middle volumes by Mr. Francis Lenygon —one dealing with the Decoration and the other with the Furniture—covering the period 1660–1770.

Not counting Shaw in his "Specimens of Ancient Furniture" (published in 1836), are we right in suggesting Mr. Percy Macquoid was the pioneer of the modern monumental works on English furniture when he presented us with his "Four Ages" of "Oak," "Walnut," "Mahogany" and "Satinwood"? It would be out of place to draw any comparison between the one series and the other, or between Volume I and Volume IV of Miss Jourdain's contribution to furniture lore. Each series and volume finds its place on the bookshelf of the art connoisseur and art decorator.

It is in the nature of such things that the volume under review deals with the furniture and decorations of the castles and mansions of the plutocrats of the Renaissance, and not with the household gods of the middle and poorer classes. Until the growing intercourse between the British Isles and the more distant Continental states, such as Italy and Spain, in Tudor times, even the great English houses exhibited but little furniture and that little of the simplest —in the main purely utilitarian tables, benches, stools, chests, cupboards and bedsteads—devoid of any ornamental details, the whole lump leavened here and there in the case, and that almost exclusively, of the religious establishments with more pretentious reflections of the contemporary ecclesiastical Gothic. The cry of the Roman rabble was "Panem et circences," but if the English hind got bread he could well dispense with the circus. In the proletarian's hut or hovel would be found such furniture as might have been constructed by Crusoe on his island. The rudest of trestle tables and pegged stools sufficed for the meagre "board" and for "bed" a truss of straw, a bundle of heather or bracken did duty on the earthen floor. A rude chest of axe-hewn planks which might, as occasion required, serve as a seat, table or wardrobe would be sheer luxury. Such things when replaced by more civilised chattels would go the way of all wood in smoke from the family hearth-stone through the hole in the roof, and so to-day the mediæval furniture of the countryside is as rare as the Dodo and excepting for the educative purposes of an ethnological museum can well be spared.

The finer furniture of the Renaissance is in quite another case being, in spite of natural displacement by newer styles, good enough in itself for preservation in considerable quantities. Many of the greater houses up and down the country still retain, and are justly proud of, the furniture built for them in the late Tudor and early Stuart days—notably such places as Knole, Hardwick and Ockwells. Stately Knole which, with its 365 rooms, stands four fronted to the four winds is in itself an epitome of English history from pre-Reformation days. It was the home of several, and the death place of more than one archbishop, and there is scarcely an English King or Queen from Henry VII who has not made a longer or shorter stay therein. The hard knocks which reduced to ruins the strong castles of the neighbouring counties and seaboard passed by this unfortified manor house which "quietly rested under the drums and tramplings of three conquests." Continuity is the key-note—one might almost say fetish—in regard to furniture and furnishing at Knole. To mention one room alone, the King's bedroom stands to-day completely furnished as it did when the Sackville's must have temporarily ruined themselves to entertain James I. It is on record that the bedstead alone with its gold and silver thread worked hangings cost £8,000, and the entire suite, including the silver toilet service, upwards of £20,000. "Time, which antiquates antiquities and hath an art to make dust of all things, hath yet spared these minor monuments." Near by in the Leicester gallery hangs the portrait by Mytens of James I, painted on the occasion of his visit, and underneath stands the identical X-shaped Venetian chair in which he appears seated in the picture—the very same chair which was copied for the coronation of King George V.

We are not writing a complete history of Knole, and neither does Miss Jourdain of this or any other house of the Renaissance. Such things have been well done and may still be better done. Miss Jourdain has amassed a wealth of matter, both in illustration and text, which must prove invaluable to all students of period furniture and furnishing. She not only gives us carefully-selected and, in most cases well-authenticated examples of furniture, but the original, or at least appropriate, backgrounds either from photographs as they stand to-day, or from old prints, lithographs or water-colour drawings. The frontispiece, a reproduction of Joseph Nash's water-colour drawing (1870) of "The Hall, Littlecote, Wiltshire," is a sheer delight. To many of the examples such as screens, panelling, ceilings, staircases, furniture and stained glass quarries, are appended working drawings of details set out and measured to scale.

That many of the illustrations are of old familiar friends (at least to some of us) makes them none the less welcome. Figures 278 and 300 (in collection 21) have fascinated us for years and we should like to know more of their past history and provenance, which have, for some unexplained reason, been shrouded in mystery. The two pieces—a draw-table and a buffet of Elizabethan type—have sufficient details in common, palpably carved by the same hand, to establish their kinship and point, perhaps, to the earliest examples of the English "suite." The rouge dragon and lion carved supports of the buffet shelves suggest the heraldic devices of Queen Elizabeth, and we may well surmise that they were made for and adorned one of the Queen's country houses.

A number of references are made in the book to Bradninch House, which lies in a fold of the hills above the Culm Valley, near Exeter. Built by Peter Sainthill, Recorder of Bradninch, in 1547, on the site of the old rectory, it is—or the one wing which remains—an example of the smaller and less pretentious manor houses of the period. Severely plain as to its exterior, it encloses a panelled room, known as the Job room, which is comparable with the panelled room from Sizergh Castle now at the South Kensington Museum. Here we have English renaissance carving at its best. The flat pilasters, each different, are adorned with carvings of fruit, flowers, musical and warlike instruments, amorini and memento-mori. The great fireplace is surmounted by an overmantel, carved in alto-relievo with Job's trials, Abraham's sacrifice, and Jacob wrestling with the angel. The chief glory of the Job room is its inner state porch, and if we cannot all go to Bradninch, we can at least go to South Kensington and see the Sizergh Castle room, or sit at home and read "English Decoration and Furniture."

L.C.C. Regulations Relating to Reinforced Concrete, and Steel Frame Buildings. With Explanatory Notes. By EWART S. ANDREWS, B.Sc. (London: B. T. Batsford, Ltd. 7s. net. Revised Edition.)

The first forty pages contain the official regulations revised to date applicable to large structures in the London area, and will be therefore of the utmost interest to structural engineers and builders. It is divi sections relating to beams, pillars, stru foundations, &c. Each paragraph be bered, enables ready reference being the sections to which the author's ex notes apply. These notes are entirely so that confusion between regulations notes is impossible. The notes and occupy some 24 pages, and will doubtl much assistance to those engaged in s design, particularly those with little e in reconciling the official requirements continuous advance in structural engin the modern frame buildings.

Garden City Houses and Domestic (27, Tothill-street, S.W. 1.) Price

This is a fourth edition of the wor has been revised and enlarged. The divided into three sections, as follows duction with Typical Specification; and Plans of Interiors; Details. It il the designs of many architects well-k their domestic work, and numerou details.

Colour and Comfort. By JOHN GLOAG trations by Palmer Jones. (Duck Co., London.) Price 7s. 6d.

The author, in his introduction, says the purpose of this book to suggest economical uses of colour in twentieth houses," and in this we think he ceeded, for the book contains numerous tions for colour schemes of present-day Many of the schemes are very gay furniture modern in design. A coloured piece by Mr. Palmer Jones is given.

The Panelled Rooms: VI, The Walthan Room. (The Victoria and Albert M Price 1s. 6d.

An interesting account of this roo about 1530, with numerous well-rep illustrations from photographs and drawings. The book is another addition to the excellent series the au are producing from time to time.

Art Work. No. 2. (The Art Work P Co., 37, East Castle-street, W. 1.) 3s. 6d.

Art Work is a quarterly magazine, with present-day work. The number contains many interesting articles, "The Direct Carvings of Alan Durst," ton Parkes; "Thoughts on Furniture with illustrations by P. Gordon Russ many others. Other contributors are Craig, Frederick Etchells, Wyndhan Omar Ramsden, Joseph Thorp, and It is edited by Mr. Herbert Wanthier.

ARCHITECTURAL EDUCATION.—II

By W. S. PURCHON.

I.—SCHOOL AND OFFICE.

previous article an attempt was made with various aspects of general educa- the architect, both before and during essional training, and while the latter less more immediately interesting both young student and to the critic of of architectural education, it is indeed to over-estimate the importance of the

oment we leave the question of general n and touch upon the professional, the of school *versus* office is at once While there are those who for years en convinced that this is no longer a , and doubtless a much larger number re been so convinced in more recent nd notably by the exhibits at the Congress on Architectural Education, still some architects who feel that the is by no means settled. In any case tremely probable—no matter to what he general superiority of the schools demonstrated—that for many years yet hod of office training, possibly in a form, will be continued, at all events maller towns and in districts remote e greater schools of architecture. It fore imperative that the matter be to with an open mind, and the various of supplementing school training with perience, or of giving office-trained facilities for obtaining some help from ols, should be carefully investigated.

first place it will surely be agreed at t, at its very best, office training is at remarkably fine way of entering and for the profession. One has only for a moment of Norman Shaw and of architects who had the good fortune hrough his office. Under such circum- he students are carried along by the m engendered by contact with a great ty, and clearly, under these special s, the best of all results may follow. ately, men like Shaw are not s. There are, however, many archi- o, while they would be the first to suggestion that they rank with Shaw other giants, are men of high standing profession, carrying out a considerable f excellent work. Assuming that they ng to take pupils—and it is an essen- of the problem that frequently the hem decline to do so—what is to be and against articling a pupil in one of their offices, assuming, again, that is prepared to work steadily and has ability?

our of such a system it may be said pupil, at the end of his period of will be familiar with the methods of e, and would be better able to start n that office as a junior assistant than school-trained man. He should be ed to the routine of the office, and master's manner of design and con- al methods. He would perhaps be with the materials his chief would r different types of buildings, and ssibly have some little practical know- professional practice, the writing of ions, the measuring and plotting of premises, and in some cases he might uired a slight knowledge of estimates, s and land surveying. He would also e sort of drawings his chief usually he local authority, the client and the respectively, and, if given a small job on his own, would possibly be able it out more or less on the lines normal office. The design subjects on which l has worked have probably all been ly practical ones, and he will, no e familiar with the difficulty of work- a definite cost. If his chief is a specialist, he will quite likely have obtained some extremely useful information bearing on the design of a particular type of building.

In certain of these ways, and possibly in others, he would clearly be the superior of the school-trained student, and it is probably largely for these reasons that a number of architects still look askance at the schools. Put the office-trained student in a strange office and his immediate superiority over the school-trained man, while possibly still there, would be much less marked.

On the other hand, the disadvantages of office training are lack of systematic instruction, actual waste of time, particularly in the early years, and relative waste of time caused by the study of subjects in the wrong order; and while the hard-working student may overcome some of these disadvantages, there is often a lack of discipline which adversely affects even the average student, and has a markedly bad effect on students below the average. There is also in the office an absence, as a rule, of that competitive spirit which plays a large part in the success of the schools. It has been said that some architects take more pupils than they can look after, and while this may possibly be the case, a number of pupils in one office, given adequate instruction, may, because of the opportunity for competition, have a better chance of development than the solitary pupil. A great difficulty in the office system is the enormous amount of available information which is floating about, with little or no guidance to the pupil as to which parts should be selected for careful assimilation and which rejected.

The systematic training in the schools is one of their great advantages: the students taking the various subjects in the right order, and not proceeding to a higher type of work until they have dealt adequately with its "prerequisites," to use a term common in the American schools. The time of the student should be well spent from the moment he enters the school; for him there is no period of six or twelve months or more during which he is "finding his way about." The average level of draughtsmanship is considerably higher among school students than among office pupils, and the former have, on the average, far less diffidence about tackling a big highly-finished drawing than the latter. In design, the school student, while probably less familiar with the difficulties of actual design in practice, has been trained on general principles, and is thus better able to tackle new problems. He has probably acquired a considerable grasp of a particular manner of design, his imagination has been well stimulated, and his attempts at large subjects should have increased his grasp. He also has, on the average, greater ability in seizing on the essentials of a problem.

Until comparatively recently it may be that the student in the school was behind the office pupil in the smaller matters of construction. but the schools have been considerably strengthened in this direction recently, and it is probable that the student leaving a school at the end of his course would have not only a broader grasp of constructional methods but also a greater familiarity with their details. In fact, the tendencies of the leading schools are towards an improvement in the normal methods of working-drawing preparation. In the calculations of structures the school student generally receives a better training, and in this subject, again, his studies of general principles will rapidly bring him ahead. In the matter of specifications and professional practice, the well-trained office pupil may, at the moment, have the advantage, but increasing attention is being paid to these matters in the schools, where once more the study of fundamental principles may well do a useful service.

In the case of the R.I.B.A. and other student competitions it has been suggested that the standard has fallen with the development of the schools. The accuracy of this statement, however, has by no means been demonstrated, and it is probable that a complete exhibition of winning designs over a long period would show a steady improvement. The falling off of entries in certain cases in recent years is doubtless due to causes very different from that implied by the above suggestion, one of them being that during his period of training the school student has little time for external competitions.

The question of examinations may be a relatively small one, but here the school has a distinct advantage over the office, the student in the schools being expected to take his examinations in his stride—as examinations ought to be taken—while the office pupil is more or less obliged to look upon his qualifying examinations as matters for which he has to make a special effort apart from his normal work. Unfortunately, many pupils make small headway with these examinations during the period of their articles, and, as assistants, find it increasingly difficult to devote adequate time to them. It may also be said for the schools that the strong lights of inspection and examination beat down on them: they are compared one with another and a steady effort is made to improve their standards and methods year by year.

The problem, however, is not one of the school only *versus* office only, for the schools definitely and clearly realise the need for office experience and make provision for it. The R.I.B.A. requires candidates for the Associateship who have passed successfully through a five-years' school course, not only to pass an examination conducted by the Institute in Professional Practice but also to have spent twelve months in gaining practical experience. While the necessity for the R.I.B.A. examination in Practice may not be clear to all, as it may be argued that the schools and their external examiners might well deal with it adequately, the need for the obtaining of practical experience before granting the Associateship will be fairly obvious. This experience originally had to be obtained in the office of an architect, but under a new regulation half of the necessary time may now be spent with a builder or on building works.

The pupils in offices clearly realise, too, that the office alone cannot provide all they need, and for many years now they have supplemented their office training as well as possible by attending evening classes in such subjects as Architectural History and Design, Construction, etc. This, of course, was largely stimulated by the increasing importance of passing the Institute examinations. The disadvantages of this method are fairly obvious, both students and teachers being more or less tired in the evenings. In Scotland some such studies are taken in the early mornings. In either case the time for preparation is probably inadequate, and the strain too great.

In other cases pupils in offices attend two or more half-days a week at a school of architecture. While this is much better than the evening method, it is still far from ideal. If the school is a full-time one the pupils naturally find that they cannot keep abreast of the normal school students, and so get discouraged. There is also a tendency for them to feel that when at the school they are having a holiday from the office. The method interferes with continuity of work at the office and does not give the student enough time to settle down to the school work.

Under the system in vogue in the "Recognised" schools the students attend full-time at the school for the first three years, and then give six months full-time at the school and office alternately for two years. On the whole this works well, for after three full years and six months at the school the student is really able to benefit from office experience. Various suggestions for the modification of this scheme have been made from time to time, one being that the student should start with,

say, a year of office training. This has the advantage that the student would begin his school work with an increased facility in drawing and some slight knowledge of office methods, but these advantages are probably outweighed by the fact that the first year in an office, in the case of a student entering straight from a secondary school, is probably the least useful one, and that the experience gained in it would be of little use in the student's subsequent school training. Another suggestion is to the effect that the school vacations in the first three years should be spent in architects' offices. The disadvantage of this is that it would take up time which might be more profitably devoted to sketching and measuring. A compromise might well be effected here, however, the student giving his first two summer vacations to sketching and measuring, and his third one to office experience. This would clearly result in his periods of office training in his fourth and fifth years being of far greater value to him, and it would be an undoubted help to him in his fourth-year work in the school. In any case care should be taken to see that the summer vacations are wisely used by the students.

The school system has had a longer trial in other countries than in our own. We have gained much from the riper experience of other lands, and it seems clear that the schools of architecture have demonstrated their value here as elsewhere. It may safely be said that those who have given most thought to the subject would only in most exceptional circumstances advise a student living within reach of one or other of the "recognised" schools to enter the profession in any other way.

The case of the students living in areas remote from the schools must, however, be considered carefully. Those who can afford to go up to a large centre and pay for board and lodgings in addition to tuition fees will surely be well advised to do so. There will be, however, many who are debarred by financial or other reasons from adopting this course, and the problem before them is no easy one. It may be that in other professions this problem is ignored, but it would be unwise for us to adopt that attitude.

Such students will doubtless enter the profession as architect's pupils and will probably take correspondence courses, attend evening classes, or perhaps, in some cases, part-time day classes in institutions which have not yet obtained the recognition of the Royal Institute, and in some way the welfare of such students should be carefully safeguarded. Steps should be taken to ensure that they do not enter the profession until they have reached a reasonable standard of general education, and t then be encouraged to take advanta best education in architectural matt able in the area. While these ed opportunities may not reach the sta quired for Institute "recognition," to the advantage of the profession them working in the right directi Royal Institute, with the help of its Architectural Education, its Allied and the existing recognised schools useful work here, the heads of t possibly acting in an advisory capaci

A more important point, perhaps, students who for any reason have be the opportunities given by the schoo surely be well advised, if they can arrange to do so, to put in a year at a school after serving their arti (possibly) after having passed the Intermediate Examination. For this there is very clearly a real need for a scholarship scheme working under the of the Royal Institute. Such a schen be of inestimable value to students districts remote from the schools, an receive the strong support not only Allied Societies directly affected, but the local education authorities and th of Education.

Tower Screen, Coleshill Church, Birmingham. MR. W. H. BIDLAKE, Architect.

[This memorial screen is 10 ft. 9 in. by 12 ft. 6 in. in size, executed in oak, and was recently erected by Messrs. Geo. M. Hammer & Co Ltd., of Bermondsey.]

LEGAL SECTION

NOTES ON CURRENT CASES

Options in Leases.

re have recently shown, in commenting everal decisions which have been given Courts, great care should be exer- n inserting options in leases either to se or to continue the lease, if litigation e avoided. The latest case is Stewart *v.* t (*Weekly Notes*, October 25). By a dated June 12, 1912, made between Maria Winter, therein called the lessor expression included the person for the being entitled to the reversion of the d hereditaments), and the defendant, premises and a shop were leased for of twenty-one years from Lady Day, but terminable at the end of the first or fourteen years by either party giving other six months' notice in writing, the eing £65 for the first seven years, £70 the next seven years, and £75 to the the term. But later in the lease it was d that if the lessee should be desirous ing a further lease for a term of seven and of such his desire should give the six calendar months' notice in writing the expiration of the term of twenty-one then (provided that the lessee should duly performed and observed the nts in the lease) the lessor would grant lessee a further term of seven years, ase to be in the same form with such ations as the lessor's solicitor might e, at a rent of £80. The freehold re- had become vested in the plaintiff. ill be seen the term of seven years ex- Lady Day, 1917, the further term of n years would expire Lady Day, 1924, e twenty-one years would expire Lady 931.

ugust 20, 1923, the defendant informed intiff that he desired to exercise the and have a further lease of seven years nt of £80. In reply, the plaintiff in- the defendant that he declined to grant er lease, and enclosed a formal notice, August 25, that, pursuant to the pro- contained in the lease, he was desirous rmining the tenancy thereby created, ve notice that the tenancy would cease rch 25, 1924. That would be at the end rm of fourteen years. An originating ns was then taken out by the plaintiff, Order 54A, for a declaration that upon e construction of the lease the tenancy created was duly determined on 25, 1924, notwithstanding the previous of the defendant purporting to exercise ion. The Court said that the construc- the two clauses in the lease was by ans easy to interpret, but held that the e clause which conferred the option was to the penultimate clause which con- the power to determine the lease. It not be reasonable to construe the lease tling the lessee to a reversionary lease nd of the term in 1931 in circumstances the lessor had determined the lease in or to construe the option as preventing sor from determining the lease as pro- t the end of seven or fourteen years; re the plaintiff was right in claiming e lease was duly determined. It thus s that at any rate the option could not rcised before the second period of n years had at least commenced, but r it must be exercised exactly six months the expiration of the lease or could be t any time when the last period was upon was not decided, as this question arise.

Clerks of the Peace.

cision of considerable importance to of the Peace has now been decided by the f Appeal in Thornely *v.* Lord Leconfield and Others, reported in the Court below in *Weekly Notes*, October 25, and on appeal, *The Times*, November 21.

The plaintiff was bringing this action against the defendants, the Standing Joint Committee of the administrative county of West Sussex, for a declaration that his tenure of the offices of Clerk of the Peace and Clerk of the County Council was a freehold tenure and that a notice in writing given to him by the defendants to determine his tenure of those offices was ineffective. The plaintiff had been appointed to the above offices in 1913 by the Standing Joint Committee on the terms of a resolution, which had been communicated to him beforehand, which stated that the appointment was subject to certain conditions one of which was that six months' notice should be given by either party to determine the appointment.

The case really turned upon the interpretation to be placed upon certain sections of the Local Government Act, 1888. Section 83 provides, "Subject to the provisions of this Act for the protection of Clerks of the Peace holding office at the passing of this Act the following provisions shall have effect: (1) The Clerk of the Peace of a county besides acting as Clerk of the Peace of that county shall also (subject to the provisions of this Act as respects particular counties), be the Clerk of the County Council and in that capacity is referred to in this Act as the Clerk of the County Council. (2) He shall be from time to time appointed by the standing Joint Committee of the County Council and may be removed by that Joint Committee." Section 118 subsection (1) provides, "A person holding office at the appointed day as Clerk of the Peace of a county besides continuing to be such Clerk of the Peace shall, subject to the provisions respecting certain counties in the Act mentioned, become the Clerk of the County Council and if appointed before the passing of this Act shall notwithstanding anything in this Act hold his offices by the same tenure . . . as heretofore."

The Court below had held that the Act of 1888, except as to appointments existing at the time the Act came into force, had repealed former Acts which made the office of Clerk of the Peace a freehold office subject to good behaviour and that now there was nothing to prevent the appointment being made upon terms which provided for the termination of the office as was done in this case. The Court of Appeal has now reversed this decision and it is unnecessary here to detail the reasoning of the Court as the effect of the judgment may be summarised briefly as follows: The Act of 1888 did not create a new office: Clerks of the Peace retain their office as such, distinct but new duties are added as Clerks to the County Council, the office remains, therefore, as heretofore an office for life subject to good behaviour.

Managing Directors on Municipal Councils.

The decision of the late Mr. Justice Bailhache in the case Lapish *v.* Braithwaite created a great deal of agitation in those persons who had been elected to serve on municipal councils but were managing directors of companies with which the councils might have dealings, but it has now been reversed on appeal by the Court of Appeal.

The action was brought under section 41 of the Municipal Corporations Act, 1882, to recover penalties from the defendant for acting as an alderman whilst he was disqualified from being a councillor by virtue of section 12, he being a shareholder in, and managing director of, a company which had a substantial contract with the Corporation of Leeds. It may be said at once that Lord Justice Bankes, in the Court of Appeal, in giving his judgment, said the only evidence in reference to the defendant's having taken any active part in making the contract was that he was one of two directors who signed the document as witnesses to the affixing of the company's seal.

The case turned upon section 12 of the Act, subsection (1) (*c*), "A person shall be disqualified for being elected and for being a councillor if and while he (*c*) has directly or indirectly by himself or his partner any share or interest in any contract or employment with, by, or on behalf of the Council." But in subsection (2) it is provided: "But a person shall not be so disqualified or be deemed to have any share or interest in such a contract or employment by reason only of his having any share or interest in (*a*) any lease, sale, or purchase of land or any agreement for the same; (*b*) any agreement for the loan of money or any security for the payment of money only; (*c*) any newspaper in which any advertisement relating to the affairs of the borough or council is inserted; (*d*) any company which contracts with the council for lighting or supplying with water or insuring against fire any part of the borough; or (*e*) any railway company, or any company incorporated by Act of Parliament or Royal Charter or under the Companies Act, 1862." The majority of the Court of Appeal held that a managing director has not "a share or interest" in a contract within the meaning of subsection (1) (*c*), and that the judgment given for the plaintiff for penalties must be set aside.

One or two general observations may be made on this decision. In the first place, it is to be noted that the Court of Appeal was careful to say on what facts the decision was based, that is to say, it must be taken as applying only to the case of a person who is an alderman or councillor who is also a shareholder in and the managing director at a fixed salary of a very substantial company having a contract with the council, there being no evidence that the person as managing director took any active part in the negotiation, preparation, or supervision of the performance of the contract beyond that which a managing director might be presumed to take in the ordinary discharge of his duties, and no charge whatever of misconduct or bad faith as against the person as alderman or councillor.

Lord Justice Atkin delivered a strongly dissenting judgment, holding that a managing director has a very substantial interest in the contracts of his company, and that a statutory provision so important to the purity of local administration should be strictly enforced.

We may have to refer to this decision when it is reported in the Law Reports. At present it is reported in the *Times*, October 24. It is to be observed that the decision of the majority of the Court turned upon the disqualifying portion of the section, subsection (1) (*c*), as, if the defendant did not come within that, it was unnecessary to consider the exceptions; but apparently this company was a company under the Companies Act, 1862, and therefore, *qua* shareholder, the defendant would be within the exception in subsection (2) (*e*), and the reasoning of the Court appears to have been that if the substantial interest as a shareholder is excepted and does not disqualify, it would be unreasonable to hold that disqualification was intended for a less real and substantial interest as managing director. Lord Justice Atkin pointed out that a managing director might have a direct interest, as he might receive increased remuneration on a percentage of profits. In the judgment of Lord Justice Bankes it is particularly stated that the managing director to be within the decision must have a fixed salary, but we do not know whether this would meet the question of percentage remuneration mentioned by Lord Justice Atkin.

One thing seems clear, that this decision will make it more difficult to prove cases where there has been some undue interest in obtain-

ing a contract by persons who are acting in the dual capacity of councillors and managing directors of companies, for this is proved by the very careful reservations made by the majority of the Court of Appeal on the facts to which the decision delivered is to apply. All those reservations are matters of fact very difficult of proof, whereas the simple fact that a managing director contracting with a municipality is disqualified from acting as a councillor is one which almost proves itself. There are two sides to every question, and the argument seems to have been that if the Legislature was to be taken to have intended to exclude such persons, some of the most capable men in every municipality would be prevented from giving their services. We leave it to our readers to consider which view they themselves would adopt.

REPRESENTATIONS MADE ON SALE OF HOUSE WARRANTY

A CASE reported in *The Times*, November 8, Lawrence *v.* Hull, is of interest to those purchasing houses. The action appears to have taken the form of damages for breach of contract on the sale of a house in the following circumstances. The plaintiff had seen an illustrated description of the property by well-known house agents in which it was described as "in first-rate order throughout," and he had gone down to see the property. The defendant was an old man of 86 years, and the plaintiff did not see him, but was interviewed by his wife, and in his evidence the plaintiff said she had assured him that the house was in such good order that one could not spend half-a-crown upon it. Two or three days later the plaintiff again saw the defendant's wife and she again repeated that the place was in perfect order. The plaintiff, however, decided at that time not to purchase, for reasons connected with the neighbourhood. About a month later the property was put up for sale by auction by the agents, but the reserve price was not reached and it was withdrawn. About three weeks later the house was again advertised by the agents and described as "a desirable freehold residence in perfect order," and the plaintiff again got into touch with the defendant, and on April 19, 1922, signed an agreement to purchase at £10,000, which was £7,000 below the reserve at the auction. This agreement was in a form prepared for the auction and contained a statement that the residence "is in good order throughout, having always been well maintained." This form contained the conditions of sale, which, amongst other conditions, provided "the property is believed and shall be taken to be correctly described in all respects . . . and if any error, mis-statement, or omission in the particulars be discovered the same shall not annul the sale nor shall any compensation be allowed in respect thereof."

The plaintiff went into possession May 26, and he then found that owing to dry rot and other matters repairs were required and he had to expend £257 16s. 9d. on these repairs, which sum he was seeking to recover from the defendant. There was no allegation that the defendant, who had spent much money on the property and had lived in it for 40 years, did not honestly believe that it was in good order. The plaintiff, however, apparently relied (1) upon the statement made by the defendant's wife on his behalf, and (2) more particularly on the statement in the agent's advertisement.

As to the verbal representations made by Mrs. Hull, the Court held that there was a distinction between a mere innocent misrepresentation and a warranty; the former might justify the purchaser in declining to go on with the contract, but if he did go on with it he had no remedy; to have a remedy there must be a warranty, a contractual part of the bargain, and there was no ground for holding that any such contractual obligation had been offered in the statements relied upon, but even were that the case the plaintiff had at that time decided not to go on with the purchase. Then, as to the statements in the agent's advertisements, the Court held that these did not constitute a warranty. Such statements are intended to induce persons to go and look at a house only. On this point it may, however, be well to note that the Court indicated that it was possible that such statements made by a vendor's agents might in equity prevent the vendor from enforcing specific performance, but this was not the case here, where the purchaser was relying upon the statements as a warranty. There is sometimes serious cause for complaint in the highly coloured statements made by house agents and we have ventured to point out on former occasions that even to send a person to inspect a house on a statement that cannot be supported in fact is bad for business, as on inspection the inaccuracy is usually easily discoverable, and the would-be purchaser is discouraged from relying on the agent's statements, but in this case seeing the amount of the purchase money and the sum claimed when all repairs were executed by the purchaser, about 2½ per cent. on the purchase money, even the expression "perfect order" does not appear very imaginative, although the expression "good order" used in the form for auction might be safer.

It is not easy to say what will constitute a warranty, but in the case Heilbut, Symons & Co. *v.* Buckleton (1913, A.C. 30), in the House of Lords, Lord Moulton, with the concurrence of Lord Haldane, then Lord Chancellor, laid down that the question whether an affirmation made by the vendor at the time of sale constitutes a warranty depends upon the intention of the parties to be deduced from the whole of the evidence, and the circumstance that the vendor assumes to assert a fact of which the purchaser is ignorant though valuable as evidence of intention is not conclusive of the question.

PUBLIC HEALTH ACT: CLEANSING CESSPOOLS

A POINT has now been decided in the case, Whitbread & Co., Ltd., *v.* Staines Rural District Council (*Weekly Notes*, November 15), which was left open in the case, Leck *v.* Epsom Rural District Council (1922, 1 K.B. 383; see *The Builder*, August 18, 1922).

In 1903, the defendant Council had voluntarily undertaken the cleansing of cesspools in part of the Staines district known as the parish of Ashford, and the plaintiffs were the owners of six houses in that parish. Until the year 1910, these six houses were drained into separate cesspools, but in that year the Council had requested the plaintiffs to drain into one large cesspool, and this had been constructed under the supervision of one of the defendant's sanitary inspectors. In 1917, during the war, the defendants had passed a resolution to the effect that, owing to the shortage of labour, plant and materials, all former resolutions with regard to cleansing cesspools throughout the district be rescinded, and that the surveyor be empowered to arrange with individual householders for the use of the Council's engines, materials and apparatus for this purpose, provided that no part of the cost should fall on the rates. The above resolution was advertised in a local newspaper, and householders were thereby informed that they should apply to the surveyor for information as to the facilities which could be granted by the defendants during the war and until the re-establishment of normal conditions.

In January, 1919, the plaintiffs had made a request to the defendants to cleanse the cesspool in question at their (the plaintiffs') cost, and such notices appear from the report to have been given until June, 1923; but on March 28, 1923, the defendants had served on the agent of the plaintiffs a notice alleging that a nuisance existed on the premises, arising from the cesspools and drains being foul and in such a state as to be a nuisance and injurious to health, and they required the plaintiffs to provide o ditional and sufficient covered cesspo modation for sewage matter on the The plaintiffs alleged that the nuisa plained of was due to the failure of t dants to cleanse the cesspools at such t at such intervals as might be reasonab sary, and that their agents had by lett April 16 and 23 required the defen cleanse the cesspool at such times and i but the defendants, by letters dated and 24, denied that there was any o upon them to so cleanse the cessp refused to do so. The plaintiffs, in th claimed a declaration that the defenda bound at their own cost to cleanse the at such times and intervals as might b ably necessary. The case is only yet re a headnote, and it is not quite clear wh cesspool had been cleansed at the cost at all; the report states, "On Ja 1919, the plaintiffs, by their surveyo a request in writing to the defendants t the cesspool at the plaintiffs' cost, and done until June, 1923," but then the re on to state the complaint of the de as to nuisance was made on March 2 This point does not seem material to the but we mention it as we cannot state quite certainly.

We now come to the judgment, and th said the case raised a short but importa under sections 42, 43 and 44 of the Health Act, 1875, which was, whet defendant Council, having in 1903 und the task of cleansing the cesspools, 1917 absolve themselves by resolution f duty of cleansing the cesspools furth

Section 42 provides that every local a may, and when required by order of th Government Board shall, themselves un or contract for the cleansing of . . . ce The Court held that the word "unde in this section does not refer to any und or promise made by a local authority other body of persons to do any work, b it merely refers to the performance of th and except where an order of the Local ment Board is in question, the section i an enabling section.

Then the Court held that section 4 imposes penalties upon local authorit have undertaken or contracted to clear pools, who fail without reasonable e excuse to perform the operation after r writing from the occupier of any house, impose the obligation for ever and does vide it cannot be got rid of, and under se it appeared it had to be ascertained wh the time of the failure to do the work t authority was still undertaking to per Thus the action failed, as from the construction of the three sections the Co there was nothing to prevent a local a which had once undertaken these duti subsequently relieving themselves of t gation, and the Court also held that t thus expressed was in accordance w opinion expressed by Mr. Justice A Leck *v.* Epsom Rural District Council.

The point now decided was not, h directly decided by the Court in th There the Urban District Council ha certain period always emptied cessp request, but they had subsequently p resolution that in future they would emptied free of cost at certain stated The householder in that case had asked his cesspool emptied between the specifie and on the Council's surveyor having that it could only be done at the house cost, the householder had laid a c before the justices under section 43. Th on appeal from the justices, who had d the complaint, held on the facts of the there had been a reasonable fulfilmen duty imposed by the statute and th was "reasonable excuse" for not oc with the householder's requirement, court in that case did not decide whe Council had "undertaken" the dut section 42.

THE TOWN-PLANNING INSTITUTE

W. T. LANCASHIRE (President) took
r at the opening meeting of the session
Institute held recently at 92, Victoria-

e commencement of the proceedings a
congratulation was ordered to be sent
Neville Chamberlain, hon. vice-presi-
his acceptance of the office of Minister
h.

Presidential Address.

President delivered his presidential
in the course of which he said he
nded many meetings of the Institute,
s able to realise the wonderful educa-
nfluence it had provided for those en-
n a calling which had to face new
s—not that planning of cities and

o say, "It is enough"; and it was certain that no reconstruction could ever quite take the place of a well-planned original building or laying out of a city. The physical, financial and other difficulties to be encountered were so great and numerous. Some of the local authorities still appeared to be unwilling or unready to start their schemes, which had to be ready, at any rate in a preliminary form, by the year 1929. It was regrettable that this should be so; the advice one would give them was to make a beginning as soon as possible, the more time for studying the problem the better. They ought not to allow themselves to be hurried in such a matter; a scheme should be considered in all its bearings, and, if time was available, it ought to be thought out more than once in order to do it justice. It was not right that a problem affecting the welfare, the business, and in many ways the health and happiness of a community, should be approached with anything but a high regard for the importance of the subject, or in any light and airy way which might result in the production of a third-rate scheme. Under their present social system, and very likely it would be much the same under any modification likely to be brought about, they were subject to waves of full employment followed by periods of unemployment for many. Probably no human wisdom would guide the steps of the dwellers in this sphere so that all would always be arranged for the best, and they might still experience further world disturbance, to be followed by periods of bad trade; even in times without war they knew there were ups and downs in trade to deal with. Fortunately the Act of 1909 had caused many of them, at any rate in large centres, to put on their thinking caps; and when, after the war and the hectic period of trade immediately following, they experienced the unexpectedly rapid slump, they were in a position to take out of their plan rooms drawings showing plans and sections of miles of new roads, widenings and sewer extensions to meet future requirements which were ready, without delay, and which found work for a very large number of the unemployed.

In view of the possibility of further periods of bad trade and of having to find further work for the unemployed, there was one point which should be considered. There was a missing link between town-planning schemes under the 1909 Act and the Unemployment Relief Works Act of 1920. Most town-planning schemes would give local authorities power to make roads only after three months' notice. In many cases they would not be able to wait long enough to give this notice to carry out the work under a town-planning scheme, and, therefore, they would have to work under the Unemployment Relief Works Act, which would mean that the Council might have to lose the money unless it proceeded under the powers of the Ministry of Transport and bought land on each side, and this not all Councils were prepared to do. Under the arrangements for work in Leeds for the unemployed they had had all sorts of agreements with land owners; some gave nothing, some gave land, and some agreed to terms on what may be called town-planning conditions. It was not fair to treat owners in this differing way, and it was hoped that powers would be taken to enable owners to be dealt with on consistent lines, so that they might have even-handed justice all round. It could probably be done by allowing local authorities to carry out work under some modification of the Unemployment Relief Works Act on plans laid down in a town-planning scheme, giving the owner slightly better terms, perhaps, than if done under the town-planning scheme itself.

It was with great satisfaction that they saw the growth of the creation of regional planning committees. Any officer to a local authority engaged upon planning his own area must welcome the tendency in this direction. It was so easy to take too small a view in preparing a scheme, and it would not be at all surprising after a regional plan had been prepared if it be found that a local scheme had been put forward which conflicted with some larger interest. There was a further point in connection with thinking regionally. They were arranging new areas for electrical distribution. It seemed certain that to control and distribute water supplies properly, with fair consideration to small as well as large communities, they would have to divide the country into regions for this purpose also. They were assembling many local authorities into regional planning committees for road-planning and other purposes. They certainly ought to have drainage boards or some system for general control of sewage disposal so that the amenity reason for town-planning schemes should have its full weight. They had a Royal Commission sitting upon the subject of local government areas. Was all this movement proceeding in a haphazard way which would permit the lines or boundaries for one purpose to cut across those for others, and, if so, was this desirable? It was hoped that some one brain, if not of an individual then of a Government department, was bearing in mind all the possibilities of the movement.

As soon as the housing shortage was diminished the question of dealing with slum areas would no doubt receive more attention, since all parties were agreed as to the necessity for action in a matter which injuriously affected so considerable a proportion of their urban population and assisted in keeping them in the category of C3. This reconstruction would involve in many towns large areas of the older portions, and since the number of houses per acre in them was very large, it would be impossible to rehouse the people disturbed on anything like the original areas, so that there must be a large exodus on to sites at present unbuilt upon. To deal with this question called for the consideration and re-planning of larger areas than those likely to come under the ban of unhealthy area schemes, and brought prominently before their minds the fact that they were still without powers for town planning in already built-on areas. In dealing with large schemes in Leeds for street widenings one came across difficulties involving considerable cost in re-doing work which was not very many years old, because those who dealt with the widening and improvement schemes of the past had no general plan for the reconstruction of the central area to guide them in the matter. It was, moreover, in evidence from various centres that streets had been widened on more than one occasion, no doubt largely due to the fact that if improvements were carried out in a piecemeal fashion a sufficiently comprehensive view could not be taken. Engineers to local authorities often had brought to their minds the feeble position their authorities were in by their inability to proceed with street improvements without obtaining Parliamentary powers, which process involved delay and no doubt in some cases extra cost by reason of the granting of leases when such proposals were under consideration. Surely large authorities, say, of the standing of county boroughs, might be entrusted with the requisite powers without taking up the time of Parliament in this way.

The question of housing and the present day conditions and influences were bringing about a great change. The production of houses for the working classes through the old channel of private enterprise appeared to have dropped down to a minimum, and it was quite possible that it might never again be able to fully re-assert itself.

Housing must go on and municipalities would have to face the difficulties and build the hundreds of thousands of houses for which the country was calling out. This would, no doubt, result in somewhat better site planning, but where would it be done?

Synchronously with the movement or trend of opinion casting upon local authorities the

obligation to build working-class houses themselves appeared the cry that no extensions of towns were to take place except with the consent of the inhabitants of the outside areas affected. These two waves of opinion would materially affect the location of the new houses, in many cases they would be located on inferior sites, as it was extremely unlikely that local authorities would plant their new estates with all their inhabitants and rateable value outside their own areas as long as there was land within upon which they could build, though in many cases they ought not so to do. These questions all affected the planning of their cities and towns, and it seemed that they should look for someone to take a wide view of the situation who would put on one side all the cries raised by interested parties and map out a policy which considered only the welfare of the people. Too much might be made of the cry of autonomy, and there were many large industrial areas and districts in the kingdom which should no longer be hampered by haphazard boundary lines, defined ages ago, which had no bearing upon present day considerations. Having referred to the fact that Leeds had created a satellite suburb at Middleton in the area taken into the city in 1919, the President said if towns were not simply to add area after area of built-up lands round the older parts, it must be made possible for the larger communities to have their boundaries enlarged, so that some unbuilt upon spaces might be left open, and it should be realised that with the progress in rapid transit, the larger centre could now efficiently control a much larger area than would have been the case a quarter of a century ago, that it had the will and the means to locate its population on well spread out plans if it was not hampered by limitations which to-day were not reasonable or justifiable. If it were held that the extension of boroughs, etc., and the reduction in the number of small authorities was generally undesirable, it should be possible by some development of regional administration to have larger matters dealt with by those best able to think on broad lines, leaving matters of less magnitude to the representatives of the smaller bodies. Two points would thus be secured. The unreadiness of the larger authorities to spend their money outside the limits of their present boundaries would disappear, and the smaller units would still preserve their separate life as far as it might be considered advisable for them to do so; the number of public representatives would be increased rather than diminished. It might be asked, "What has this to do with town planning?" The making of plans would, of course, proceed without any such changes being brought about, but those who were in close contact with the subject knew how very desirable it was to have the question of local government areas settled and how great a bearing financial questions had in the conception and execution of town-planning schemes.

In conclusion, the President referred to the recent visit of the Institute to Leeds and the interest which had been aroused.

On the motion of MR. H. T. STILGOE, seconded by MR. DAVIDGE, a vote of thanks was accorded Mr. Lancashire.

British Industries Fair, Birmingham.

Owing to the proposed re-opening of the British Empire Exhibition the Department of Overseas Trade has decided to suspend the London section of the British Industries Fair until 1926, as a temporary measure for 1925 only. Arrangements have consequently been made by the Birmingham Chamber of Commerce to organise sections in their Fair for industries which have hitherto exhibited, and would ordinarily exhibit, in London, provided adequate support is secured. The British Industries Fair at Birmingham will be held from February 16 to 27, at Castle Bromwich Exhibition Buildings. Applications for space should be made at once to the General Manager, British Industries Fair (both sections), The Chamber of Commerce, 95, New-street, Birmingham.

WEST MIDDLESEX TOWN PLANNING*

THE report of the West Middlesex Joint Town-planning Committee is the first regional report to be completed for a portion of the Greater London area, and it will, therefore, have a special interest for all interested in the future of London. The County Council of Middlesex have already done good work in the carrying out of the Brentford By-pass or Great West-road, as it has been named, and from the geographical situation of Middlesex it is one of the first necessities of the case that a good system of arterial roads should be provided. The Western-avenue from Shepherd's Bush to a point on the Oxford-road beyond Uxbridge has already been commenced at the London end, and a beginning has also been made with the new Chertsey-road from Chiswick across the Duke's Meadows. New river bridges will, however, be required both at Chiswick and Richmond, and it will inevitably be some few years before this great improvement is completed in its entirety. A further new arterial road is projected to by-pass Wembley, Harrow, and Watford.

Middlesex has always taken a wide view, too, on the subject of open spaces, and for many years has made a definite grant towards the purchase of open spaces and parks by the various local authorities in the county. It is, therefore, particularly interesting to see that the Regional Committee recommend a wide extension of the policy of acquisition of open spaces for the public, and among the larger open spaces suggested for acquisition are Syon Park, Osterley Park, Cranford Park, Hanworth Park, and Hovendon Hill.

Another excellent suggestion is for the reservation of a strip of park land alongside each of the many tributary streams of the Thames which pass through Middlesex. The Brent valley, the Yedding brook, the river Crane, and the Wyrardisbury river are all suggested as suitable for preservation in this way, and an excellent example is thus set for the rest of the Greater London area.

In addition to the broad arterial roads already provided for, a number of the quieter existing roads are suggested for conversion into parkways, planted with trees and with wide grass margins, thus linking up the larger open spaces throughout the county. The preliminary zoning is limited in broad lines to the laying down of areas suitable for shops and business premises, and also to suggesting the retention of the south-western portion of the county between Stanwell and West Drayton for its present purpose of market gardening and agricultural uses.

An all-important point which is stressed in the report is the need for the laying down of building lines on all main routes, and it cannot be overlooked that this is one of the ways in which improved conditions can be obtained both for residences and traffic, with little or no expenditure of public money. The map published with the report shows the proposals in detail, and will be of great assistance to the local authorities in working out the details in connection with their own town-planning proposals.

The rapid growth of factories in Middlesex along both railway and canal frontages is distinctly ominous, and it is a matter for regret that practically the whole of the frontage to the Great Western Railway, and of the Grand Junction Canal should be allocated in the report to industrial purposes. To reserve so large and continuous an area of land for industrial purposes is, in our opinion, a mistake, and to condemn the next generation to approach London through some ten solid miles of factories is not a proposal which can be regarded with equanimity. It is to be hoped that this suggestion will be considerably modified before the next stage is reached, as it considerably mars an otherwise excellent report.

* West Middlesex Joint Town Planning Committee Final Report. 10s. 6d. E. S. W. Hart, Hon. Sec., Guildhall, Westminster.

ARCHITECTURE IN TOWN PLANNI

IN his seventh lecture on Town P at Birmingham University Mr. Haywood, F.R.I.B.A., said the appear city buildings was much affected by th acter of the roads upon which they The formal planning of the Place de riere and its adjuncts at Nancy, and curves of the High-street, Oxford, we known examples of formal and inform planning which were favourable to a tural expression. The interminable streets of cities arranged in che fashion, established one of many co unfavourable to the effective combina roads and buildings. An infinite ra nuances in design was made possible right association of roads and buildings setting of the Paris Opera House, stance, was not without some dramatic yet they knew that its designer, G bitterly resented its insufficiency; and doubt a setting of different proportio shape would vastly improve its value

On the other hand the citizens of U that the full effect of their beautiful dral was obstructed by adjoining bu which, on removal, were found to be so sary a foil to the scale and character church that they were at once replaced people were affected directly or indire their environment, and since the qua buildings was so large a part of envir in town life, it was worth while to no this quality was determined chiefly predominant character of architectural age, and less directly by the actual de of buildings than was usually supposed magnificence of Ancient Rome was a of the political force of its Dictators; t venturous and soaring architecture o old cathedrals was due to the religio vour of the Middle Ages; the splend Renaissance architecture originated stately outlook of old aristocracies; and of the present architectural force o came from Napoleon III's appreciation great political significance of national tecture. Out of such patronage as th building was almost inevitable.

They lived in a democratic and com age, and the education of democracy appreciation of something more than existence, had been a necessary prece any demand for great architecture. Bu mercial and democratic America now for fine building, and was gettin England, too, showed some signs of a ing, and wherever people had come appreciation of fine living, an adequate tectural expression in town structure not be lacking.

Incorporated Church Building Societ

At a recent meeting of the Incor Church Building Society grants were towards building new churches at :—So St. Matthew, £250; Hesketh, All Saints South Lancing, St. Michael and All Angels Sandiway, St. John-the-Evangelist, Wembley Park, St. Augustine, £300; Ll Martin, £400. Towards enlarging or re the churches at :—New Brompton, St. £150; Farnham Common, St. John-the gelist, £100; Gaywood, St. Faith, Hanslope, St. James, £125; Newcastle Holy Trinity, £150; Northfleet, St. B £150; Over, St. Chad, £120; Reddal H Luke, £100; Watford, St. Michael a Angels, £200; Worthen, All Saints, From the Mission Buildings Fund, a gra made towards Wigmore Church, Gilli £100. The following grants were also m works completed at :—Ilford, St. Andrew Swansea, St. Nicholas, £100; Walthamst John, £360; Wardington, St. Mary Mag £100. The amount granted this year, £9,000, is already much larger than the of grants made in 1923. The Society needs more help, and is dependent upon tary support.

E ASPECTS OF THE HOUSING QUESTION

E. DROWER, C.B.E., lectured recently
ie Surveyors' Institution (South-
ranch), Westminster, on this subject.
rse of his lecture Mr. Drower, after
rvey of the housing question during
w years, said housing had been a great
talk and argument, and the Govern-
v it. A Ministry of Reconstruction
d long before the end of the war, and
important tasks was to deal with the
uestion. It gathered information as
ls; it took advice from philanthropists
xes; it enlisted the services of archi-
vn planners, and surveyors. The
re embodied in various publications,
enough to read, and full of plans of
ightful to look at. No working man
d to live in such houses, and what the
the country would have been had

dy of any kind except as a temporary
; as a permanency it was entirely
There were two obvious methods of
ith the gap; one was to put the worker
ition to pay the rent, which meant one
ease his wages and make them certain,
econd was to work from the other end,
ase the cost of the building to such
hat the tenant could afford to pay a
upon the capital expended.
cuss the former method would lead
ng way away from housing, and would
dicated by all sorts of controversial
. Therefore let them turn to the
nd consider how the cost of building
decreased. The speculating builder
build houses for the working classes
h the State subsidy, but he could get
it in many cases for suburban houses,
it would be a hopeless case in agricul-
ricts. The State subsidy for an urban
was not the total subsidy; it did not
deficit by some £12 a year at least as
e, taking all sorts of houses in all sorts
; the rates were charged with that
A speculating builder got only the
sidy and nothing from the rates; it
a fair handicap. Could he make up
plus a profit for himself, if he were
o employ his own methods? The
hought he could do so very nearly.
nearly was not enough; he must do it
nd earn a profit and a living beside.
eculating builder was not dead; he
much alive; but he had changed.
e housing of the working classes alone
ven he could not build them to pay.
l turned to another style of house, to
was too big for a subsidy and built
s of society which could, or thought
fford to pay a fair price for the houses.
d not build to let, he built to sell.
not be plagued with rent collecting
te management. He feared Rent
n Acts, actual or prospective, so he made his profit, cleared out and started afresh. That was good business for the builder, and large profits had often been made by it; but it was not always so good for the buyer. He was not speaking of isolated cases but of many in which this buying of houses had brought calamity. Tempting terms were offered by the builder, a small sum down, a little more on completion of purchase, and the rest by easy instalments. Despairing of being able to rent a suitable dwelling, many a young couple had accepted the terms and found that they had hung a millstone round their necks.

Let them sum up the advantages and otherwise of the two systems of providing houses, by the speculating builder or by the local authority. The former was cheaper, the latter gave better building; the former was a more flexible method, it was ready to adopt at once any new idea which had proved itself to mean economy; the latter was more rigid and disinclined to move from the paths set down by plans, specifications, and contracts. So long as subsidies had to be paid by the State, and rates had to come to the aid of the housing schemes, so long would the State and the local authorities expect to have a measure of control. Was there no way by which the advantages of both systems could be combined? One felt that there ought to be a way, and that by careful study a method could be evolved. In the present system of contracts the builder had no incentive to suggest or to search for means by which savings could be effected; his employers would reap the benefit, not he. Looked at in this light the present system seemed all wrong, and to be a mere expedient to tide over a difficulty until normal conditions prevailed once more. And when would that happen? When rent bore a more reasonable proportion to wages. They were on delicate ground there, for a discussion on wages would lead them into all sorts of controversies as to unemployment pay and old-age pensions, family allowances, and similar matters. They could not wait until all these things were put right; the homely proverb that "Half a loaf is better than no bread" should be borne in mind; if they could not make the deficit quite good they might do it partially, and, by carefully guarding subsidies and reasonably restricting rents, they might enable the speculating builder once more to do good service to the community.

The deficit to be made up in the case of houses in urban districts was bad enough; in rural districts it was much worse, and it was made worse by the fact that houses often cost more in certain country places than they did in towns. They would want a revolution in their methods of farming before agricultural labourers' wages reached a parity with those of townsmen.

The houses built now for the working classes had to be better in design and plan than those in pre-war days. The demand for better housing was insistent even during the war; it grew in force, it was even menacing, and something had to be done, although what had been done fell badly short of the hopes and schemes of philanthropists and was a contempt to the Utopian. Much remained to be done, and the harassed and overburdened rate- and taxpayer would not be free of his burden for many a long year.

The speculating builder with his cheap methods and the great output of his labour was not yet at work in this housing. They must insist upon the importance of the question of output. Speaking about it to a great trade-union leader, the lecturer had for an answer, "Oh, I've heard that argument *ad nauseam*," to which he replied, "Well, an argument which makes the opponent sick need not necessarily be a bad argument." They all remembered the formation of what was called a "Builders' Guild." This was a new thing with an old name, for it had no likeness whatever to the old trade guilds. This Builders' Guild was an association of workmen whose real object was to increase wages and improve the condition of the workers, a perfectly laudable object to attain, which the housing scheme offered a very convenient chance. Estimates were made and statements made which convinced many people that the guild could build much more cheaply than the ordinary contractor. After all, estimates were only estimates, and in this case they proved to be wrong. The guild failed because its estimates were founded upon a great rarity, the ideal man, a sort of moral Robot, who would work like an automaton from morn till eve, never stopping, never slacking in his even pace. But bricklayers were human, plasterers and carpenters were frail, discipline was not strict; where there was that inhuman thing *equality* there was no real authority; and there was none here, the master's eye was lacking; promises proved more fragile than even the proverbial pie-crust; the guild failed. In Mr. Macdonald's book on Socialism he wrote:—

"I must note in passing the recent experiment in building guilds, where workmen who have been especially attacked for slacking and dishonest work, have organised themselves into self-governing groups, taken contracts for building houses, done better work than the private builder, in shorter time, at lower costs, and yet have paid higher wages and have given better conditions of employment. The secret is in enlisting the heart."

This is a very definite statement as of something which had actually happened. But in a footnote the author said:—

"Unfortunately, owing largely to want of capital, these experiments have not fulfilled hopes."

No! Mr. Macdonald, the guild did *not* suffer from want of capital; it was not that. It suffered because it misunderstood human nature.

Trade unionists would have them believe that the worker revolted at having to earn profits for the capitalist and works grudgingly, while, on the other hand, he would work cheerfully for himself. It was easy to denounce this as narrow-minded and short-sighted; it would be better to devise something to let the workman feel and know that he had a real interest in the work he was doing, that man could not work for himself alone, but that good work well done benefited everybody. Nobody could pretend that the present relation of capital and labour was incapable of improvement. It must slowly change. Anatole France gave it four hundred years: one century of frightful tumult and destruction, another of reconstruction, and two of settling down, but not even then for a permanency. He could not refrain from noting that he remarked, "But the English will retain their king and the wigs of their judges."

In conclusion, the lecturer said they must leave the City of the Future to the dreamers of dreams. Thackeray said somewhere that he did not object to being carried forward, but preferred the back seat of the dog-cart so that he might see the landscape he was leaving behind. His mind turned to a little West Country town, with its cob-walled houses and cottages clustered round the great old church that for centuries had withstood the storms and the wind and the mishandling of men, and had looked mutely and serenely upon many events of their history and yet stood, sturdy and time-defying. The evening mists were rising from the meadows; one by one the lights started up in the windows and the smell of wood smoke told of supper cooking for the men who, clattering and shuffling down the street, go each into his own home, slamming the door noisily behind him. The boys were playing buck-a-bee in the dusk, the last trains were creaking over the bridge, with the children shrilling "Harvest Home."

New Masonic Temple.

The Provincial Grand Master of Durham Freemasons, Lord Ravensworth, D.L., P.G.W. (Eng.), recently visited South Shields and laid the foundation stone of a new Masonic Temple and banqueting hall. The structure is being built from the designs of Messrs. J. H. Morton & Son, F.R.I.B.A., South Shields, by Messrs. Gustavus Bailey, Ltd.

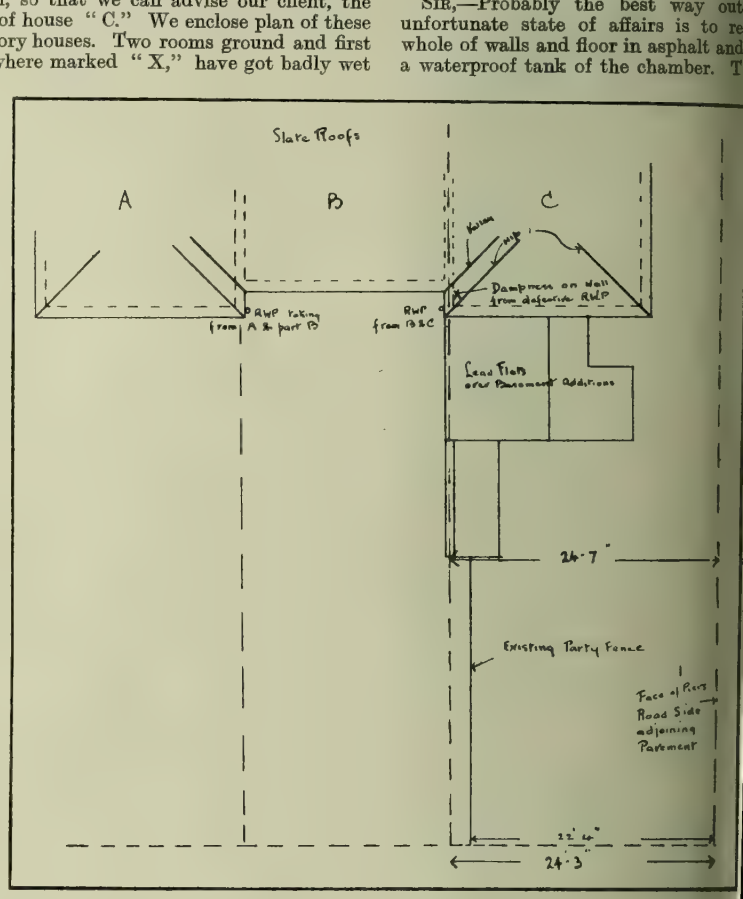
ARCHITECTS' & BUILDERS' INQUIRY BUREAU

We are glad to give questions and answers but cannot accept responsibility for contributed replies, especially on legal matters.

May we appeal to our correspondents to submit their queries on paper of a size easily filed, and written as legibly as possible, or better still, in typescript!—ED.

Creosoting Pitch Pine.

SIR,—To what effective extent can pitch pine in large scantlings be creosoted, and are you able to tell me of a practical case in the experience of its employment on hard woods as a submarine protective? Some information would oblige.



F.R.I.B.A.

[When the harbour in Bullyheigh Bay, south-west of Ireland, near Tralee, co. Kerry, was constructed during the eighties at Fenit Island, Sir Benjamin Baker acted as consulting engineer. A stone wall extended about three quarters of a mile from the mainland shore to a small island which furnished its apex or outwork. In this harbouring gangway an intermediate outlet for the purpose of scouring the harbour basin was contrived by the erection of a series of piles carrying on the harbour way level with the masonry right and left of this piled water easement. The original draft of the contract specified that these piles must be of "creosoted memel or creosoted pitch pine," but in the final form of the contract the draughtsman verbally changed this provision to "creosoted memel or pitch pine." This alteration in the wording caused considerable trouble. Some authorities contended that the meaning was identical, "memel or pitch pine," the adjective governing the use of either timber. Others urged that pitch pine could not be effectively creosoted, as it is too hard and close in texture and, like teak and greenheart, resists the injection of this preservative, as happens successfully with memel.

By the time this discrepancy in the letter of the contract was discovered, the contractors had already fixed several of the harbour piles, all of which were of pitch pine uncreosoted. The Government settled the dispute by compelling the contractors to agree to finish the work with creosoted pitch pine and give a guarantee that, should the piles already in position prove at any time faulty or unfit to remain, the condemned piles would be removed and replaced by creosoted pitch pine ones, free of all charge. The piles that had been creosoted proved efficient, notwithstanding that the creosote had only penetrated into the pitch pine an eighth of an inch. This mere skin or coating had, however, preserved the timbering from the attacks of the sea worms commonly known as the "teredo navalis," which before long had reduced the uncreosoted Fenit pitch pine piles to mere skeletons, aided no doubt by the Atlantic and millions of the submarine wood-louse (the "Limnoria terebrans") in company with the wood-boring shrimps, "Chelura" (ever-busy). Bethell's process of creosoting coagulates the albumen of the wood, filling the pores with an oily liquid; and for marine work the inventor specified 10 lb per cu. ft. in memel as necessary. In pitch pine this could not be accomplished, but the Tralee piles demonstrated that far less would suffice when the creosote was well impregnated to form a skin about one-eighth of an inch throughout. The "Teredo" worm grows to a considerable length, and has a shelly substance in its head shaped like an augur, so that by revolving its body it can bore into the wood, as it did into the uncreosoted pitch pine piles. The creosoting barred the way. There are two varieties of these worms, one kind going in at right angles across the grain, and the other sort follows the way of the grain. Thus their united inroads disintegrate the balks precisely as this Irish harbour work demonstrated.]

A Damp Party Wall.

SIR,—As regular subscribers to your journal, we shall be grateful if someone can give us an opinion, so that we can advise our client, the owner of house "C." We enclose plan of these four-story houses. Two rooms ground and first floor, where marked "X," have got badly wet

and paper is spoiled through rain-water pipe on outside being cracked and pipe becoming stopped.

The wall is a party wall and the wet that penetrated came from "C" and "B" roof. It is on "B's" ground. Should "B" keep the bottom of this pipe clear? The owner of "C" would have been quite satisfied if "B" was willing to meet him in the cost of papering, but he has refused to do this and has since sold his house. Can "C" get any redress from either the old or new owner of "B"? The owner of "C" has put the rain-water pipe in order at his own cost, but the wall really needs re-pointing. Should "C" bear the cost of this?

The dotted line on plan shows the area and measurements of ground on the deeds owned by "C," as the light iron fence now erected is two feet in his ground. Can he recover this strip, approximately two ft. wide? The house agent who sold "B's" house has written "C" on behalf of the orginal owner of "B," saying he intends not to help him out over the cost of his repairs and re-papering.

"BUILDER."

Decoration of Walls.

[REPLY TO "STUDENT," NOVEMBER 7.]

SIR,—Before plastering the walls, the distemper must be thoroughly removed and well brushed down, and the joints of the brickwork raked out as a key to the plastering. Keene's cement on a backing of Portland gives a surface that can be at once decorated without fear of spoiling. The painted work must, however, follow the trowel, *i.e.*, the first coat of paint must be applied immediately the plaster has hardened sufficiently to stand the brush.

The cost of this work would be in t
bourhood of £35 to £40. "SOL

Concrete Garage.

[REPLY TO W. STEVENSON, NOVEM

SIR,—Probably the best way out unfortunate state of affairs is to re whole of walls and floor in asphalt and a waterproof tank of the chamber. T be done for about £25, and the outlay well worth making.

Ventilation.

[REPLY TO S. T. C., NOVEMBER

SIR,—The old Tobin tube was an invention, and has led to many devel Rather a more modern way, and equally would be to provide the radiators wi plates that will throw up the current air in much the same way as the tube. the usual modern practice. "UP-DRA

Zinc Gutters.

[REPLY TO E. H. DASHWOOD, NOVEM

SIR,—The best treatment for the p zinc gutters will be to well clean the coat with bitumastic paint, and in b a second coat when the first has dri work should be executed in dry we protected from the rain until quite dr

SIR,—In my opinion, based on long ex no stopping or painting will effectu perforations or defects in zinc gutters o I have a case in hand now. Renewal is satisfactory remedy.

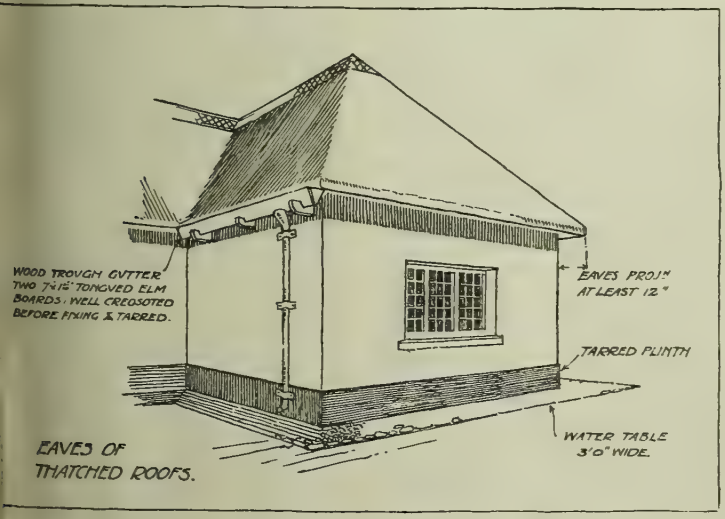
cent job, it was held that as the shear is zero, it would be better to cut the A."

R. C. ARNOLD.

ur correspondent is quite right.—ED.]

Foundations.

o MR. HENRY LOVEGROVE, NOVEMBER 21.]



The foundations of a building are truly portant thing. The use of good modern nd, still more, of reinforced concrete, a great extent simplified the problem. -soils require a certain spread of con- prevent overloading by a heavy super- . Concrete is generally adopted as the table material with which to answer ose. It then remains to avoid over- he concrete itself. In the case of a ively weak mix of concrete, this must by a generous spread of brick footings, is little fear of this with good cement and in most cases it can be proved k footings are redundant in the vast of cases of modern buildings. Upon ly designed reinforced concrete raft is an obvious absurdity, which is fully d by the L.C.C., who invariably accede plication for relief in such cases.

" LONDONER."

Thatching.

o " OLD-FASHIONED," NOVEMBER 21.]

Us don't fix shuting to offices of us stick 'em out all of a foot and ted pebble stones for water-table all se and us tars plinth to catch splashes. datch be'ant worth saving.

nust have gutter, make un of two ¾ in. elm boards tongued together, lots of creosote, specially in joints, stuck up on wood brackets, and then per. Don't 'ee go for to use zinc or for pipes, being as datch water'll ut in no time. " DEVON."

answer to the inquiry of " Old- " we use and find quite satisfactory to eaves gutter made of two 6 in. by 1 in. creosoted (under pressure) rough deals put together in the form of a " V," run with pitch in bottom and coated with tar inside (see sketch). We fix these to the walls on local made W.I. brackets, although wood ones can be made up. Outlets are formed of square boxing in the form of straight " swan necks " delivering into the ordinary R.W. heads and down-pipes.

TRAYLEN & LENTON.

SIR,—Rain-water spouting in a thatched building is best executed in " V " shaped water troughing carried on wooden brackets, from the face of the wall, and discharging into the head of a down pipe through a short piece of wood pipe inserted into the troughing vertically. The troughing should have the external leaf rather deeper than the internal, to catch the throw-off from the roof. " WESTERN."

Hollow Walls.

[REPLY TO " CAVITY," NOVEMBER 14.]

SIR,—In reply to the query by " Cavity " *re* hollow walls, I have experienced the same thing viz., damp patches appearing at fairly regular intervals in hollow walls built of brick. On removing the bricks behind the damp patches, it was discovered that a large number of the twisted metal wall ties were carrying mortar which had evidently deposited there during the building of the wall, thus forming a direct connection between the two thicknesses. This was, of course, caused through not using a piece of wood which should have rested on the wall ties—as the work proceeded and continually lifted up clear of the wall cavity—so as to keep the space quite clear.

W. W. HITCHINS.

SIR,—In my opinion your correspondent " Cavity " is right in assuming that the damp travels across the wall ties. The reason undoubtedly is that the ties, where damp appears, have not been cleared of mortar droppings, and that the damp is conducted thereby to the inner thickness of the wall. I have seen similar cases from the same cause before.

" F. H. F."

[We have received a further reply from " Pro bono publico," which has been sent on to our correspondent.]

SIR,—Some fifty or sixty cottages were built in exposed positions, all having 11 in. cavity walls of comparatively porous bricks, some covered outside with cement (rough cast), others with the brickwork left bare. In only one case was there any trouble with damp in the rough-cast cottages. This was traced to a batten carelessly left in the cavity, and was cured. In nearly every case, the cottages with bare brickwork showed slightly damp patches on the inside of the south and west walls, after the first winter. I am convinced that this was caused by the heavy charge of water in the outer skin, saturating the air in the cavity with moisture which condensed on the inner wall, especially when, on sunny days, the outer wall was the warmer. The damp was more marked in unheated rooms. Cavities were opened and found to be quite clear. After fine weather the more exposed fronts were treated with " Sterelmy," or with boiled oil, to waterproof the outer 4½ in. wall, and the trouble has not recurred. Efficient through ventilation of the cavity is of great importance, and also care in making the cavity clear and continuous around chimney breaks and openings, especially behind the countersills of windows. " DEVON."

Timber Markings.

A reply to their inquiry for a list of timber markings has been sent to Messrs. G. Baines & Son.

Stone Flags.

SIR,—I should be glad to know what is the best method of bedding stone flags, whether dry, or on a mortar bed.

" GARDENER."

Aberdeen Granite.

SIR,—Could any of your readers kindly give me any information as to the different varieties of Aberdeen granite ? " ENGLISHMAN."

ARCHITECTURE AND THE BUSINESS MAN

MR. H. G. WATKINS, F.R.I.B.A., lectured recently on this subject before the members of the Nottingham Rotary Club. In the course of his address the lecturer said the impulse of the great architectural periods of the past had been either religious—as in Ancient Greece and in the mediæval period—or Imperial power, as in Rome. This was a commercial and democratic age. The question was, could a modern democratic country, such as their own, the dominating factor in which was commerce, produce architecture to compare with the great works of the past ? A very bad commencement was made during the Victorian period of rapid industrial development and they were paying a heavy penalty to-day for the errors of that period. Their cities grew up haphazard, became uncomely, dull, dreary, monotonous, smoky, and dirty; and a great work rested with them in altering these conditions. It could be done only gradually, but foresight and the long view were necessary, and, above all, the education of the general public and the business men that architecture, and due regard for the amenities of their cities, did matter.

The lecturer said he was not pessimistic as to the outlook ; there had been in recent years, and was, a steady improvement in the architecture of their shops, warehouses, and industrial buildings. Architects were paying far more attention to the problem of designing shop premises which should, as far as possible, satisfy the principles of architecture, and yet give the retailer the reasonable amount of glass he demanded. The retailer was realising that an architectural building was an attraction to the public, and that the artistic display of his goods was becoming more and more necessary.

The lecturer commented favourably on the erection of rows, which gave scope for design and adequate structure. He expressed the hope that the row tradition would be observed in the building to be erected on the Exchange site, and urged that the designs for the new building should be thrown open to competition to the architects of the country in order to obtain the best solution of the problem.

New London Theatre.

Messrs. Arthur Vigor & Co., Ltd., who are at present building the Plaza Cinema and the practically completed Capitol Theatre, have secured the building contracts for a new theatre, to be called the Carlton, which is to be erected on a site in the Haymarket.

THE BUILDING TRADE

NEW METHODS OF HOUSE CONSTRUCTION REPORT

THE interim report of the Committee on New Methods of House Construction, of which Sir Ernest Moir is Chairman, was recently issued by the Ministry of Health. The Committee say :—

Lord Weir's house is essentially a timber-framed house faced externally with steel sheeting. There is, therefore, nothing very novel in the principle of its construction, and there is abundant evidence that houses made of steel on wooden framing can be considered as a reasonable method of providing immediate housing accommodation. Such houses have been occupied, when properly maintained, either as dwelling houses or as meeting places of various kinds for many years from the date of their construction. Lord Weir is, however, devoting much time to investigation and experiment with the object of perfecting this form of construction, and particularly with a view to adopting such methods of standardisation as will lead to cheapness in large scale production and to rapidity of building without utilising the skilled branches of the building industry. As regards speed of construction, we are satisfied that houses of the type proposed can be erected rapidly on the site.

Houses faced externally with steel sheeting are not so resistant to high temperature nor so easily kept warm when the temperature is low as houses made of brick. Measures are proposed, however, by Lord Weir to minimise this difference, and we do not anticipate, if these are adopted, that serious objection can be taken to the house on this score. The Committee have also given attention to the risk of sweating on the inside of the outer steel plate and to the difficulty of obtaining access to the back of the plate for purposes of painting, but as a result of evidence we have heard, we do not anticipate that there will be any trouble under these heads. Another criticism made was that the internal partitions, ceiling members, purlins and boardings showed too light a scantling, and it was suggested that the internal linings were not sufficiently strong. The scantlings can, however, be increased and the necessary strength given to the inside linings and partitions by modifications in design. The houses for which Lord Weir has so far worked out his proposals are of the bungalow type; we understand that he is giving consideration to the adaptation of his principles to the two-storied dwelling, but that he is not at present in a position to undertake the erection of this type.

We have not attempted a criticism of the types at present developed so far as plan and elevation are concerned; we think it sufficient to say that we are satisfied that the method of construction presents no difficulty in the way of providing satisfactory accommodation and pleasing appearance. From an architect's point of view the necessary sameness of the buildings in any extensive scheme is some disadvantage and necessitates careful attention to lay out, colour scheme and grouping. It is obvious also that a long bungalow type involves additional cost in respect of roads and allied services. There remain the important considerations of first cost, rent obtainable, maintenance and effective life of houses of this type. On the question of cost it is impossible at this stage to give a final judgment, exact figures not being available. Lord Weir's work has largely been of an experimental nature, and he is naturally not yet in a position to state finally what reductions in cost he will be able to make as a result of quantity production.

In view, however, of the general opinion of the Committee that the life of such houses will be shorter and the maintenance charges will be greater than in either a brick or concrete structure, and on the assumption of an equal income, it is necessary that such houses, if they are to compare on an equal financial basis, should be cheaper in first cost than brick or concrete houses.

In view of the very great need for houses and a hope of some economy in first cost and of a potential life of possibly up to forty years provided that adequate maintenance and care be forthcoming, your Committee is satisfied that, subject to the criticisms we have made, this type of house is one that is deserving of encouragement and might form part, at least, in the meantime of the structures that go to house the people, particularly in cases where cheap land is available, where foundations are doubtful, and where for any reason more permanent types of buildings cannot quickly be provided. With this object we suggest for consideration that local authorities and others concerned in the carrying out of housing schemes should be encouraged to undertake voluntarily the erection of houses of this type in sufficient numbers to enable the system to be properly tested.

THE STEEL HOUSE

FROM A SCOTTISH CORRESPONDENT.

THE large numbers who have visited the steel house recently exhibited at the Kelvin Hall, Glasgow, is an indication of the keen public interest on all matters pertaining to housing. The housing problem grows more acute every day, and the need for a speedy solution is imperative. It is to meet this demand for quicker production that the steel house is being put on the market, and in this respect it scores over the brick house.

The general idea that a steel house can be erected and made ready for occupation in a few days is, however, quite erroneous. Certainly the carcass of the house can be put together in a very short time, but there are some parts of the work which cannot be speeded up any more than in other types of houses. For example, foundations have to be laid down and time given for the concrete to set. Next, when the framing is completed, there is the internal plumbing work, which requires the same time as in any standardised brick house. The laying of water and electric or gas mains, the provision of a drainage system, the erection of boundary walls or fences, and the external and internal painting work are all matters which require time. The average estimate for the completion of the house may be put as from five to seven weeks. A brick house of the same size and of standard type would take about three weeks longer.

It is from this point of view and also from the standpoint of mass production, giving a corresponding reduction in cost, that the producers of the steel house hope to relieve a national problem and supply a shortage which cannot otherwise be adequately met. There are, however, a large number of private individuals who are prospective house purchasers, and who are considering the possibilities of the steel house with a view to suiting their requirements.

Taken as a whole, the house exhibited at Kelvin Hall has a well-proportioned appearance, and the red roofing tiles lend a colour and warmth sufficient to overcome the appearance of the more unsympathetic material. The rivets on the face are not prominent and in no way detract from the elevation. Certainly the plainness of the frontage is relieved by the rose trellis work, but whether or not roses would flourish against the steel background is a matter for experiment. The rhones provided strike me as being on the small side for the depth of corrugation of the roofing tiles. The ridge tiles at the bottom of the hip spars are too open and would give too good a catch for the wind. This is a small point, but a point worthy of consideration in a climate such as ours.

There is a good weatherproof fi window cases, which are riveted the steel walls. Instead, however, opening panes, these windows sh the entire casements made to o house is certainly of a fireproof co but furniture, upholstery, and in nishings do not preclude the possib fire, and a fixed steel casement c ready means of escape. Again, a s but worthy of attention.

The general plan is well worke the frontage is well balanced various apartments. The lay-out i cal, and every inch of space is adva used. The general supply of cup however, not too generous, and a c board in the living room, with the hiding the rather unsightly heating would be a distinct advantage. Th on the right of the front door is no with a fire, and for this reason wou better for a roof ventilator.

The only part of the building in steel work is too predominant is lobby, and the general "aboard e pearance might have been avoided use of a metal framing, surfaced w board or asbestos cement sheets. teriors of the various apartments are with asbestos-cement sheets, panel wood strips—a style which is gro popularity and which gives a small pleasant and comfortable appearance

The outside walls, consisting of st air space and asbestos-cement sheet, however, be sufficiently insulated extremes of heat and cold, and a material (slag wool, for example) t place of the air space would render more comfortable.

As to the heating arrangements in a bungalow design one looks fo one interior grate or, failing that, register. The love of an open fi general, and a house without one too modern to be comfortable. T stoves provided are certainly effic they are not pleasant features in well-designed rooms. The cooking the living-room is of good type, and capable of tackling the family requ Regarding the plumbing work of t this appears of a standard lower tha taining in many housing schemes. vanised-iron hot-water cylinder and iron piping have a low first cost, but cylinder, copper boiler, and copper pipes might well be substituted. T der as it stands at present is a large to be economical.

Many of these points are common types of houses besides the steel hou theless it would repay any prospect purchaser to give them considerati details of the house would lead to that the proposed low cost of the does not come from any saving in t ence between the cost of the steel the cost of brickwork, but is to be the fact that prices in other parts of have been cut to a minimum. The or ence in price between a brick hou steel house must lie in the cost of t all other parts of the houses being is difficult to see where much econon obtained. The current price for bric for bungalow houses runs usually a per super. yard. Making allowance plumbings at corners, window a jambs, one may take as a figure super. yard. The current price of p is £12 per ton. Using ⅛-in. plate t out approximately at 4s. 9d. per su add for workmanship and works' say, 75 per cent., viz., 3s. 6d. Nex the framing material, say, 2s. p yard, and for delivery and erectio 1s. 3d. This gives a total of 11s.

odest estimate, and even with mass ion could not be greatly reduced. rding mass production, one thing s certainly not wanted in this country peless monotony in house design, and nvent this a large variety of designs have to be prepared. This is another which would increase costs. It would herefore, that the only point on which el house would help to solve the hous- blem is the fact that it can be erected than the brick house, and this is which is not so advantageous as at ght it would appear.

PUT IN THE BUILDING INDUSTRY

have received the following statement ir Charles Ruthen, Director-General of g, on the output of bricklayers :—

ave seen it stated in the Press that the bricklayer lays 2,000 bricks per day as 500 bricks laid by the British craftsman. atement, published broadcast and linked ference to my recent official visit to the lands, is likely to be attributed to me ould be refuted.

do not accept the statement as nearly e, and further consider that any com- between the output of Dutch and British yers requires a deal of careful quali- n. The standard Dutch brick measures imately 8 in. by 3½ in. by 2¼ in., or. v. 63 cub. in., whereas the cubical ts of the standard British brick is, v. 122 cub. in. Therefore it will be ated that the Dutch bricklayer must uble the number of bricks to produce imately the same cubical contents of l walling as that of his British brother an. Further, if a very artistic Dutch uch used in the Netherlands and exceed- icturesque in the finished work is used, mparison becomes even more impossible. ick measures 6 in. by 3 in. by 1¾ in., or, ally, 31 cub. in., and therefore nearly nes the number must be laid to produce ne volume of work as that of the British

am not prepared to admit for a single t that the Dutch workman produces ter volume of output than the British an. but would rather state definitely e quality and quantity of work produced British workmen in the building industry l if not superior to that of the workmen other country."

ERMAN BRICKS AND ITISH BRICKMAKERS

take the following extracts from an which recently appeared in *The British rker* :—

e Press is continuing to charge the brick- with deliberate and wilful neglect of his st duty in order that he may profiteer ise prices.

e statements made are backed up by ews with supposed authorities, and by ents which we are in a position to prove ncorrect.

are told first that 'many English rds are derelict and their workers loyed.' If the Press will inform us these brickyards are, and can show that e derelict for any reason other than their f value, we shall be glad to offer them many inquirers who are seeking just roperties.

are told that rings in the trade restrict We can show that a works now making ions of bricks annually will increase its to 100 millions next year. Another is hreat of an injunction for fume nuisance, e it has hastened increased production ding temporary and rapidly erected kilns. d is spending large sums of money on modern plant to make use of overburden hitherto excavated and put aside at great expense. A fourth has just completed the installation of expensive machines to double the output of stock bricks, and a fifth a completely remodelled plant on the latest model lines. A sixth is spending £40,000 to produce an additional 13 millions annually. We can continue this list indefinitely, and it should be noted that such things are being done by the firms themselves with their own resources. When we come to consider the finding of the capital for new concerns, the tale is different. Money is not forthcoming either from financiers or private individuals, except for buying up going concerns with good balance sheets. Why is this ? We can only suggest that hitherto the brick trade has not inspired confidence. Threats of compulsory acquisition by the Government and of confiscation are not the kind of gentle inducement which can be calculated to extract money from the pocket of the investor. If bricks are earning such big profits, why do not people clamour for openings in the trade for their savings ? Some firms declared a 7 per cent. dividend recently, others declared even 15 per cent., but what about the previous 10 years ? Did any brick concerns make profits except the firebrick firms, who are now in turn experiencing a very lean time ? No, the investment is not attractive, and at the same time the capital required is large. The Trade Facilities Act is too onerous in its provisions ; the Government encourages the freak builder, and labour will not work to help to house itself.

" Fletton is the villain of the piece. Most of the papers who revile its operations are not even acquainted with the district in which it is situated, and could not distinguish a Fletton brick from a Leicestershire red. It has been accused of deliberately withholding production for the purpose of forcing up prices ; it compasses the diabolical 'ring' which the Government is called upon to smash !

" What are the facts concerning operations at Fletton ?

" As far as prices are concerned, it is sufficient to say that in January, 1923, the basic price of Fletton bricks was reduced by 6s. per 1,000, *i.e.*, to 54s. per 1,000 at King's Cross (to quote the station which is taken for official records), and in May, 1923, when there was a reduction of 1s. 3d. in the railway rate, a further reduction of 1s. 9d. was made to 52s. 3d. This is the price Flettons are being sold at to-day. The increased demand came at the beginning of April, 1923, so that it will be seen that the ordinary effect of supply and demand has not been allowed to operate.

" So far as the alleged restriction of output is concerned, we happen to have seen the returns of the London Brick Co. and Forders, Ltd., who, perhaps, manufacture about 75 per cent. of the whole output of Fletton bricks. For the 10 months ended October 31, 1924, the make and deliveries were 20 million in excess of the totals of 1923, and the company estimate that they will make and deliver 100 millions more for the complete year than they did in 1923 !

" This result has been brought about by unremitting effort on the part of the firm and their staff. New machinery has been installed wherever possible ; night shifts have been introduced at certain of the works, and temporary kilns have been erected at lightning speed, in order to obviate the building of permanent structures covering a period of probably nine months.

" So much for Fletton's restriction of output.

" As to production in other quarters, what of the output of the Employers' National Council for the Clay Industries, the Kent and Essex Stock Brick Association, the South-Eastern Federation, the Midland Association, the National and the Northern Federations ? Each of these can show an aggregate of from 300 to 500 millions, and even then we have not exhausted the list. We may safely state that the capacity and output of works in this country at the present time is far greater than it has ever been in the history of brickmaking.

" Turning now to the importation of foreign bricks, Hull is said to have bought German bricks at 59s. 6d. per 1,000 because English bricks cannot be obtained at less than 80s. We can prove that manufacturers in the neighbourhood of Doncaster are selling huge quantities at 52s. 6d. per 1,000 in the works ; bricks which measure 9 in. by 4½ in. by 3⅛ in., and that they are ready to supply bricks to the Hull Corporation at that price !

" The importation into England is restricted by exceedingly difficult transport conditions and poor wharfage accommodation, and many would-be importers who thought they could deliver the goods have been obliged to abandon the business."

CHADWICK PUBLIC LECTURE

On November 19 Professor Julius Berend Cohen lectured on " Smoke : Its Cause, Nature, Effects, and Methods of Prevention," at the Royal Institute of British Architects. Sir Frank Baines presided. In the course of his address the lecturer said that the lungs were more delicate in structure and function than the digestive organs, and they could not with impunity inhale a vitiated air without permanent injury to their breathing apparatus. They might assume this, although definite evidence was difficult to obtain in so far as smoke was concerned, as the life and habits of town dwellers being so different from that of country folk mortality statistics were of little use. Smoke was produced either by an insufficiency of air or too low a temperature (or a combination of the two) for complete combustion, as instanced by a paraffin lamp burning with and without its chimney. Soot from factory chimneys was very different in character from that from domestic fireplaces, where raw coal was burnt. In the former case, owing to the high temperature and strong draught, the volatile portions of the coal were mainly consumed, whilst the draught carried off mechanically fine mineral dust and grit mixed with carbon containing little tar. Domestic soot, on the other hand, might contain as much as a quarter of its weight of tar. It was this tar which caused the soot to cling, accumulating with time and blackening every surface it touched with a varnish which was not removed by rain.

The observations of Sir Frank Baines had made it only too evident that these sulphur acids from coal (and there was no other source than coal) attacked masonry. Historic and beautiful buildings all over the country were undergoing slow but certain destruction. Fabrics, leather bindings and metal work were being similarly attacked. What was the remedy ? So far as factory smoke was concerned, the Public Health Act of 1875 gave powers to the local authorities to stop unnecessary smoke, and ample evidence was forthcoming before the Committee on Smoke Abatement that boiler chimneys need not smoke. A strict enforcement of these powers would stop the great bulk of factory smoke. It was difficult to legislate for the domestic fireplace. Gas and electricity were coming more and more into prominence for cooking and heating, and that was a good sign. A good deal more might be done by the gas undertakings to promote the consumption of their coke. They had their show places for gas-cookers and gas-fires. Why not other show places for coke stoves (of which there were many on the market), where they could be seen at work, and where the cost of installation and maintenance could be ascertained ? Cheaper gas, cheaper coke, cheaper electricity, and an energetic local authority encouraging their sale whilst holding a firm hand on the offending boiler chimney, would clear the air of most of the smoke.

Gracechurch-street Widening.

Gracechurch-street is to be widened to 50 ft. and Lombard-street to 35 ft. at the eastern end, where six buildings are in the course of erection.

NEW BUILDINGS IN LONDON.

Blackfriars-road.—New premises are to be erected in Blackfriars-road, S.E., as an extension to the works of Messrs. Gaskell & Chambers, Ltd., pewterers and bar fitters' engineers. A building to be used as showrooms and offices is intended, of two stories in height with basement. The construction will be of brick on a steel framework. The street frontage, about 70 ft., will be of ornamental shop windows. It is proposed to add two further stories at a later date, so the roof is to be of concrete, reinforced with steel and asphalted. The site covers about 2,000 square ft. The general contractor is Mr. James Parsons, of 190, Waterloo-road, S.E. 1. The architect is Mr. Lowell Parr, of 42, Cranley-gardens, South Kensington, London, S.W. 7.

Pall Mall.—Large branch bank premises are being built in Pall Mall, S.W.1, by the Midland Bank, Ltd. The new building will be seven stories in height with large basements, which will be used as strong rooms, stores, &c. The loads will be carried by a steel framework, supplied and erected by Messrs. Matthew T. Shaw & Co., Ltd. The elevation will be in Portland stone, supplied by Messrs. F. J. Barnes. The roof will be covered with asphalte on concrete and faced with slates. A lift will serve all floors, whilst a hoist will communicate between the banking hall on the ground floor and the strong rooms in the basements. The general contractors are Messrs. Hall, Beddall & Co., Ltd., and the principal sub-contracting firms are: Granite, Fenning & Co., Ltd.; electrical installation, Bell Bros. (London), Ltd.; ornamental bronze work, Murley Bros., Ltd.; asphalte, Thomas Faldo & Co., Ltd.; heating, Rosser & Russell, Ltd.; lift, Express Lift Co., Ltd.; hot water, Bell Bros. (London), Ltd.; casements, Messrs. Morris. The architects are Messrs. Whinney, Son & Austen Hall, of 8, Old Jewry, London, E.C.2.

St. Martin's-le-Grand.—Work has now started on the foundations of the large new head offices and warehouses which are to be built in St. Martin's-le-Grand, London, E.C. 2, for Messrs. Courtaulds, Ltd. The company have bought 12,000 square ft. of the old General Post Office site, and the extensive depth of the present excavations—some 40 ft.—will permit of two large basements being constructed. The new building will be of considerable size and will consist of eight stories, one of which will be accommodated in a Mansard roof. The roof is to be slated on the sides with green Cumberland slates and finished with a flat concrete and asphalte surface. Special provision will be made for the business to be carried on in the building, there being several passenger and goods' lifts and loading and unloading bays at the rear. Heating and ventilating, prevention of fire, electric lighting, burglar alarms, and other systems, will also be incorporated in the equipment. The building will be supported by a substantial steel framework, and the street frontages will be of Portland stone. Floors will be of reinforced concrete, as also will be the staircases, landings, &c. The window casements will all be of steel. The accommodation will include general offices, secretary's and general manager's and directors' rooms, board room, &c., in addition to warehousing and handling departments. The general contractors are Messrs. Holloway Bros. (London), Ltd., of Bridge Wharf, Grosvenor-road, London, S.W. 1. The steelwork will be supplied by Messrs. Redpath, Brown & Co., Ltd., of 3, Laurence Pountney-hill, London, E.C. 1. The architect is Mr. L. S. Sullivan, A.R.I.B.A., of 158, Fenchurch-street, London, E.C. 3. The consulting engineer is Dr. Oscar Faber, D.Sc., of 5, South-street, Finsbury-pavement, London, E.C. 2.

Buckingham Palace-road.—The large property known as the Peabody Buildings, in Buckingham Palace-road and Caxton-street, S.W. 1, are to be converted into flats and business premises. The work is being carried out in sections, the property being divided into five portions, known as A, B, C, D and E. Operations on block A are now in hand. The ground floor is to be converted into shops and involves a considerable amount of cutting away. Metal shop fronts will be installed. The upper floors, of which there are five, are to be turned into flats, each of four rooms, with bathroom and lavatory. There will be 140 flats in all, and lifts will be installed in each block, whilst central heating, hot water, electric lighting, and other services will be laid on. A part of the building will be used for office purposes, and in the centre of the property will be a restaurant, connected by service hoists with all floors. A large amount of steel girder work will be used to support the building over the shops and the other stores on the ground floor. The architect is Mr. Ernest Cannell, M.S.A., of 259, High Holborn, London, W.C. 2, acting on the instructions of Chandos Court Mansions, Ltd., Buckingham Gate, S.W.

Edgware-road.—A large block of shops and flats are to be built at the corner of Edgware-road and Upper George-street, W. 1, consisting of basement, ground floor, and four upper stories. There will be eight flats, each consisting of hall, living rooms, kitchen and offices, and three bedrooms. The shops will be double and single-fronted. Brick construction on a steel frame is being adopted with facings of artificial stone. Central heating and electric light, lift, gas and open fires will be installed. The contractors are Messrs. W. Sharman & Son, Ltd., Riverside Works, Upper Clapton, E. 5. The architect is Mr. L. S. Sullivan, of 158, Fenchurch-street, London, E.C. 3.

Holloway-road.—A large building is to be erected on the island site at the corner of Holloway-road and Parkhurst-road, Islington, N. 1, principally to provide accommodation for a club for members of the cinematograph and allied trades. It is proposed to build premises three and four stories in height. The construction will be on a steel frame with brick filling and fireproof floors, with frontages of bricks relieved by stone dressings. A heating system, of the low-pressure hot water type, supplied by a central boiler installation, electric lighting and power plant, telephone and bells, cooking apparatus, &c., will be provided. Ventilating and air washing systems and vacuum cleaning machinery will also be installed. On the ground floor, facing the street, will be a range of single and double-fronted shops, fitted with display windows and fittings to suit intending tenants' requirements. On the ground floor will be a ball-room, with a floor measuring 175 ft. × 80 ft., surrounded by lounges, chairs and tables and refreshment rooms. There will also be a billiard room to accommodate thirty full-sized tables; a large restaurant and café; reading and writing rooms, &c. The architect is Mr. S. Gordon Jeeves, of 4, George-street, Hanover-square, London, W. 1.

Hammersmith.—A further section of the rebuilding scheme is in hand at the premises of Messrs. Palmers' Stores, Ltd., in Hammersmith-broadway, W. 6. It is proposed to erect a new block, bounded by Bridge-street and the Broadway, of ground and three upper floors, containing all departments usual in a shopping emporium. The accommodation will also include a large restaurant, with kitchens, &c. One section of the plans has been completed and another is in hand, whilst the remainder of the site has yet to be dealt with. The work is being carried out by the company's building department to the designs of Messrs. John S. Quilter & Son, 3, St. James's-street, London, S.W. 1.

Wandsworth.—A new squash-racquet court is to be constructed in the factory premises of Messrs. Clayton Bros., East Hill, Wandsworth. Messrs. G. H. Carter, Ltd., of Holloway, will execute the specialist work.

Tooting.—The licensed premises, the Fountain Hotel, in Garrett-lane, Tooting, S.W., are to be rebuilt and the present accommodation considerably extended. The new building will be of four floors, with extensive cellarage, and will include public and private bars, saloon luncheon room, inside and outside lav accommodation, and residential quarters f licensee. The flooring will be of wood and position, whilst electric lighting will be inst Plans have been prepared by Mr. Malco Saunders, architect to Messrs. Watney, C Reid & Co., Ltd., brewers, the owners c property.

Battersea.—Extensions are to be made premises in Falcon-road, Battersea, S.W., by Messrs. David Thomas, Ltd., drapers, & new building of two stories is to be erect a site adjoining the present premises, the g floor of which will be fitted with shop front the upper floor equipped as showrooms. addition will be erected on a steel frame brick front and side walls. The roof w slated. Counters, cupboards and other fi will be carried out in oak and mahogany. contractors, Messrs. George Bainbridge & of 77, Terminus-road, Eastbourne, are car out the work to the plans of Mr. P. D. Ston of 58, Grove-road, Eastbourne.

East Ham.—Extensive house building is carried out in East Ham by two local One proposal provides for the erection o houses—52 in Caledonian-road, 30 in Bu road, and 38 in Holland-road—all giving th lowing accommodation: three bedr parlour or living-room, kitchen, scullery, room, and lavatory. The contractors Messrs. Dale Bros., of 74, Wood-street, Walt stow. The plans have been prepared by M R. Cheke & Co., of 11, High-street, Wans E.11. The other scheme is for the buildi 80 houses in Eustace-road and 26 in Hal road—106 in all—of a type to qualify fo Ministry of Health subsidy. The houses w built of brick in pairs and blocks of four, red tiled roofs. The contractors are the L Buildings Co., of Grove Green-yard, Le stone.

Millbank.—A new gallery for the display works of J. S. Sargent, R.A., is being er at the National Art Galleries, in Millbank, S the cost of which is being defrayed b Joseph Duveen. The new building wi somewhat similar to the gallery for Wo Modern Art, also being erected at the Ga at the expense of Sir Joseph, and will incor some novel systems for obtaining better li of pictures. The gallery will be of two and will be decorated in gilt and hard woo Heating systems and electric lighting wi be installed. The contractors are Holland & Hannen and Cubitts, Ltd., Gray's Inn-road, W.C.1, who are also bu the Modern Art Gallery. The architec Messrs. Romaine-Walker & Jenkins, of Bond-street, London, W.1.

Euston-road.—An extension appeal fu which the Duke and Duchess of York are dents, has been opened in connection wi Elizabeth Garrett Anderson Hospital for W in Euston-road, N.W. It has been deci raise £75,000 before any building work started. A legacy of £10,000 has been in purchasing a freehold site and a buildi be erected to provide larger medical and s wards, X-ray and pathological depart a children's ward, maternity and isolation A new out-patient department will be e together with an operating theatre. It proposed to erect a nurses' home, with a tion room. The buildings will be of five floors and basement, and will probal erected in facing brick with stone dressi harmonise with the existing hospital The hon. architect is Sir Brumwell Tho The Albany, Piccadilly, W.1.

LLEGE OF ESTATE MANAGEMENT

e course of a lecture on "Tithe Re- n" at the College of Estate Manage- ecently, Mr. Millard said that though ce in the rates payable by the tithe- were the chief factor in causing differ- n the cost of the redemption of the mount of tithe rentcharge in different the land tax payable and the cost of n were also of some importance. In ring the advisability of redemption in rticular case it was important to bear not only the direct cost, but also the pon the rates and taxes payable in of the land. In arriving at the rate- lue of land, the amount of the tithe rge, if any, charged on it should be , but, after the rentcharge had been shed by redemption, no such deduc- ld of course be made, and the assess- the land for rates was liable to be d accordingly. On the other hand, if was agricultural, most of the rates in respect of it were subject to an nt to one-quarter under the Agricul- ates Acts, 1896 and 1923, on the re- teable value of the land. The assess- land to land tax was also liable to ased as a result of the redemption of e rentcharge.

Obituary.

eath has occurred, at "East View," , of Mr. Richard Burrow Hodgson, enty, who for many years carried on as a builder, contractor and monu- culptor, at Keswick and Appleby.

PROPOSED NEW BUILDINGS & OTHER WORKS.*

In these lists care is taken to ensure the accuracy of the information given, but it may occasionally happen that, owing to building owners taking the responsibility of commencing work before plans are finally approved by the local authorities, "proposed" works at the time of publication have been actually commenced. Abbreviations: T.C. for Town Council; U.D.C. for Urban District Council; R.D.C. for Rural District Council; E.C. for Education Committee; B.G. for Board of Guardians; B.C. for Borough Council; P.C. for Parish Council; M.H. for Ministry of Health; M.T. for Ministry of Transport; C.B. for County Borough; and B.E. for Board of Education.

ACCRINGTON.—A project is on foot for the provision of a town hall.

ALTRINCHAM.—Plans have been approved for the erection of club premises on the corner of Moss-lane and Mayor's-road, for the Committee of the British Legion; and for the erection of 20 houses on the Oldfield Brow estate, for the D.C.

BARKING ABBEY.—Plans have been prepared by the County Architect of the Essex C.C. for the provision of a dining hall to accommodate 200 pupils at the School, at an estimated cost of £3,560.

BATLEY.—A scheme is in hand for the extensions to the Batley and District Hospital. The architects (Messrs. W. Hanstock & Son, of Batley) invite tenders for the various trades required in the building work.

BEESTON.—The U.D.C. recommend that the M.H. be requested to give approval to a further 100 houses.

BLACKBURN.—Plans have been approved by the B.G. for the erection of a mortuary at the Eaves-lane Institution.

BLACKPOOL.—A M.H. inquiry is to be held into the application by the Corporation for sanction to borrow for the following purposes: £266,513, for the extension of the seawall and laying out of the promenade at south shore; £182,226, for sea defence works at Bispham and south shore; £81,527 for the laying-out of land on the easterly side of the promenade, south shore; £15,448 for the completion of the open-air bath at south shore.—The design and plans of Messrs. Austin & Paley, architects, Lancaster, have been approved by the Vicar and parishioners of St. Stephen's-on-the-Cliffs, for the erection of a new church, which, when completed, is estimated to cost £35,000.—The Committee of the Cleveleys Men's Club are proposing to erect new club premises to plans prepared by Mr. R. H. Cunliffe, architect, of Fleetwood.

BOLTON-ON-DEARNE.—The U.D.C. has decided to build 500 working-class houses during the next three years, 250 of them in the first year.

BRIDLINGTON.—The T.C. approved plans: Mr. C. L. Waite, two houses on the Priory estate, for Mr. W. Witting; Mr. J. R. Earnshaw, house, Trinity-road, for Mr. N. Cooper; Mr. M. B. Parkin, house, Kingsgate, for Mr. Beames; Mr. C. L. Waite, bungalow on the Priory estate, for Mr. W. Witting; Mr. C. L. Waite, four bungalows on the Priory estate, for Mr. W. Witting; Messrs. Watson & Ritson, two houses, George-street, for Mr. A. H. Evans; Messrs. Watson & Ritson, two houses, corner of Kingsgate and George-street, for Mr. A. H. Evans; Mr. J. R. Earnshaw house, Kingsgate, for Mr. W. Newsome; Mr. M. B. Parkin, bungalow, corner of Shaftesbury-road and St. James's-road, for Miss M. J. Boak; Mr. L. Stewart, house, St. James's-road, for Mr. A. Clark; Mr. L. Stewart, two houses, Kingsgate, for Mr. F. Spink; Mr. J. R. Earnshaw, four houses, Brookland-road, for Mr. H. F. Hird; Mr. J. R. Earnshaw, house, corner of Shaftesbury-road and Kingsgate, for Mr. J. R. Earnshaw.

BURY.—The B.E. have been instructed to prepare a scheme of a swimming bath in the reservoir at Clarence Park, on the floating raft system, with dressing-room accommodation. The estimated cost is about £10,000.

CHELMSFORD.—The M.H. have authorised £680 for the purchase of land adjoining the Institution grounds, and also £27,327 for the erection of the new Infirmary and Nurses' Homes.—The T.C. propose erecting another 100 houses, for which the M.H. have intimated they will give favourable consideration.

CHORLEY.—The Borough Surveyor is to prepare plans for an open-air bath in Astley Park.—Plans passed: Four houses, Collinson-avenue, for Messrs. Hickman & Partington; four houses, Highfield-road, for Messrs. J. W. Lee & Co.; four houses, Preston-road, for Messrs. Hickman & Partington.

CLITHEROE.—The T.C. has received the M.H. approval to erect a further 38 houses on the Henthorne estate. The Council is now seeking permission to borrow £16,500 to carry out the work.

CLOWNE.—The R.D.C. has decided to apply to the M.H. for permission to build an additional 26 houses at Creswell, and to proceed with the erection of 30 houses at Clowne and 10 at Barlborough as soon as the Ministry's sanction has been received.

COLCHESTER.—The enlargement of the Royal Eastern Counties institution is proposed.

COLNE.—The T.C. has decided that a scheme should be prepared for the erection of working-class houses.—Mr. G. H. Walters proposes to erect a bungalow in Clare-avenue.

CROMPTON.—The D.C. are recommended to proceed immediately with the erection of a new building on a site in Farrow-street, for a child's welfare centre, estimated to cost £917. Plans have been prepared under the supervision of the surveyor, Mr. J. Fothergill.—The provision of a maternity centre is also under consideration.

DARTMOUTH.—The T.C. passed plans: Mr. R. Pillar, houses, at Townstal.

DARWEN.—Plans have been passed for the building of works in Hollins-road, for the Walpamur Co., Ltd.; two houses, off Belgrave-road, for Messrs. Robert Shorrock & Son, Ltd.

DAVENHAM.—The M.H. has notified the Cheshire C.C. that the question will now be considered of making a grant towards the acquisition of land for the proposed tuberculosis pavilion.

DEWSBURY.—The T.C. has adopted unemployment relief schemes, such as building a bridge across the Calder and Hebble canal at Slaithwaite-road, Thornhill Lees, to replace the present stone arch bridge. Roads and sewers are to be constructed on the Ravens Lodge housing site, at a cost of £18,000. It is proposed to build 230 houses on the site.

DIDSBURY.—A large residence in Wilmslow-road has been acquired for adaptation as a home for children of the Salford Rescue and Protection Society, estimated to cost £8,000.

DONCASTER.—The Surveyor has been instructed by the Market Committee to carry out alterations to steps leading into cellar under the market hall to afford a more satisfactory entrance.

DUBLIN.—Plans passed by the City Architect: Alexandra-road, warehouses, pump house, &c., for the Galena Signal Oil Co.; Seafield-road, Clontarf, bungalow, for Mr. J. A. Coleman; Castle-avenue, Clontarf, bungalow, for Mr. W. Dunne; Hollybank-road, Glasnevin, 8 houses, for Mr. A. Strain.

EASTHAMPSTEAD.—Formal sanction has been received from the M.H. by the R.D.C. to the borrowing of £5,300 for the building of and £200 for the purchase of the site for the erection of working class cottages at Cranborne.

ESTON.—The U.D.C. is considering the advisability of establishing an open-air swimming bath, at an estimated cost of £4,500.

EYE.—The Town Clerk of the T.C. reported that the Housing Committee had met the architect, Mr. Harold Hooper, in connection with the old workhouse reconstruction scheme, and it was agreed to experiment with the front portion of the premises as a first instalment, the architect being asked to get tenders.

FALKIRK.—The Dean of Guild Court passed plans: Callendar Iron Co., warehouse and fitting shop, to cost £1,250; Mr. J. Kean, bungalow in Major's-place, to cost £1,250.

FIRES.

NEW MILTON.—A fire which broke out recently in the principal street of New Milton, a small Hampshire town near Bournemouth, caused damage to business premises estimated at nearly £10 000.

NORTHALLERTON.—A fire occurred at the garage of the Metropole Garage Co. The damage is estimated at over £15,000.

THE BUILDING TRADE

According to the *Ministry of Labour Gazette*, employment in the building trade showed little change in October, except in the painting and decorating section, where there was a seasonal decline; it continued good, on the whole, with skilled operatives, other than painters, but generally slack with unskilled workers. In a few instances a little overtime was worked, but adverse weather conditions caused a certain amount of lost time on outside work.

As regards individual occupations, employment remained very good generally with bricklayers and plasterers, and good in most districts with masons and with carpenters and joiners; in a considerable number of districts a shortage of one or more of the foregoing classes of skilled operatives, especially of bricklayers and plasterers, was again reported. Employment continued fairly good generally with slaters and plumbers, and showed a slight improvement. There was a further decline with painters, and employment in most districts was very slack, as is usual at this time of the year; it remained slack, on the whole, with builders' labourers.

In the brick trade, employment in October continued good on the whole, but showed a slight decline as compared with the previous month; short time was worked in some districts, but, compared with a year ago, employment was much better. At Peterborough, Nottingham and Bridgwater employment was reported as being very good.

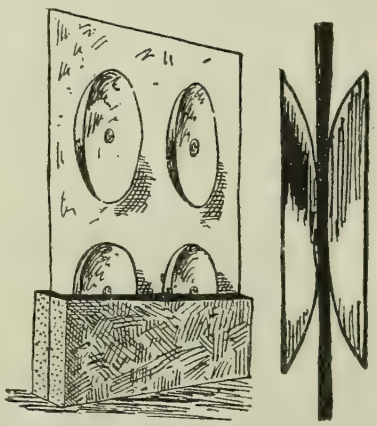
The percentage of workpeople unemployed in the brick, pipe, tile, etc., trades, as indicated by the unemployment books lodged at Employment Exchanges on October 27, 1924, was 7.8, as compared with 6.8 on September 22.

Statistics relating to Building Trades for the five weeks ended October 6 show that in the building trades 9,506 vacancies were notified for men and 7,591 vacancies were filled. The principal occupations concerned were:—Carpenters, 2,454 vacancies notified and 2,006 filled; bricklayers, 1,298 vacancies notified and 588 filled; painters, 2,221 vacancies notified and 2,066 filled; and builders' labourers, 1,408 vacancies notified and 1,281 filled.

Returns from local authorities in 142 of the principal urban areas in Great Britain (except the London County Council area), with a total population of 15,981,000, show that in October, 1924, plans were passed for buildings of an estimated cost of £4,526,600, as compared with £4,462,100 in September, 1924, and £4,446,400 in October, 1923. Of the total for October, 1924, dwelling-houses accounted for £2,991,100; factories and workshops for £213,300; shops, offices, warehouses and other business premises for £547,500; and other buildings, and additions and alterations to existing buildings, for £774,700.

NEW INVENTIONS

Showroom Ceilings.



The Army and Navy Co-operative Society, Ltd., had a number of ceilings in their Victoria-street store that were not as attractive as they would like owing to exposed sprinkler pipes and, in some cases, girders. Means were therefore devised of covering these pipes and girders,

merely allowing the sprinkler valves to protrude slightly, and at the same time carry on their business without any interruptions due to rebuilding. "Sundeala" wall-boarding was adopted for the purpose, and so far some 40,000 sq. ft. has been used. As will be seen by the accompanying illustration, the sprinkler valves are hardly noticeable. "Sundeala" is supplied by Messrs. G. D. Peters & Co., Ltd., Caxton House, Westminster, S.W. 1.

Reinforcement.

According to a contemporary a new type of reinforcement for concrete walling is being put on the market by a German concern. As shown in the illustration, this consists of sheet steel on each side of which are saucer-shape pieces of steel which, it is claimed, hold the concrete in

position whilst it is setting, and thus enable shuttering to be removed earlier than usual. The vertical sheet of steel makes the wall damp-proof, and the added strength it imparts to the concrete enables thinner walls to be used.

Woolwich Housing Scheme.

The Royal Arsenal Co-operative Society intends, subject to the consent of its members, to purchase for £375,000 the Well Hall Garden City Estate, at Eltham, consisting of 1,034 houses, 212 flats, and 90 acres of freehold land.

THE SCOTTISH BUILDER

WOODEN HOUSES

THE Aberdeen Branch of the Royal Scottish Arboricultural Society recently discussed the subject of "Home Timber and Housing" at their quarterly meeting, over which Sir John Gladstone, Bt., presided.

Provost Donald Munro, O.B.E., Banchory, in opening the discussion, said it was wise to state decisively that the home timber supplies of this country could not meantime do more than supplement in the smallest way the large quantities that were required for their housing problem. It could not be made a reason for the critical state of the housing problem that there was a lack of timber. There never was a time when the imports of foreign timber so largely exceeded the demand for it. On all hands one heard schemes for the mass production of economic houses in steel and other materials, the manufacture of which on a large scale would relieve the unemployment problem, but little or nothing was heard of the possibilities of wooden houses. It was true that the risks and dangers of fire were against the erection of wooden houses in large numbers alongside of each other, but the experience of other countries was available for their consideration. The rural demand for houses to-day was proportionately as great as that of the towns, and it was in that direction that the first steps should be taken. Most of them were aware that there were hundreds, perhaps thousands, of old houses and cottages all over the north of Scotland that had been allowed to go to rack and ruin for want of repair. These houses and cottages had, generally speaking, good stone walls, and if the authorities had only given grants for the repair of these, in addition to their subsidies for new houses, he was certain the housing difficulty, particularly in the rural dictricts, would not be so acute as it was at the present time.

During the past year a number of wooden cottages, several of them of an exceedingly attractive design, had been erected in various districts of Deeside, and it was a great pity that there were not hundreds more. Before, however, wooden houses could be erected to any extent, the Burgh Police (Scotland) Act of 1892 must be amended, and local authorities would have to relax their by-laws regarding the building of wooden houses. Further, architects and others must change their attitude towards their native timber. He had never seen a specification in connection with house-building that specified home timber. In the mansion-houses of the countryside and in many of the old Scottish castles were to be found examples of the adaptability of home timber for constructional and decorative purposes. It might interest them to know that the royal entrance hall at Balmoral Castle was panelled by Scots pine from Ballochbuie by King Edward in 1903. The billiard room in the Castle was also panelled with the same kind of wood, carefully chosen. Lord Glentanar, who was interested in the question of wooden houses, had just made arrangements to build three sets of wooden cottages at Glen Tanar. Each house would have four apartments, and the foundation would be of cement. The timber, with the exception of the roofing, would be of old Glen Tanar Forest fir. The cost of each set of double cottages was estimated to be from £400 to £500.—On the motion of Sir John Gladstone, a vote of thanks was accorded to Provost Munro.

NEW BUILDINGS IN SCOTLAND

Paisley.—SUB-STATION.—The Dean of Guild Court has passed the following plans: Electricity sub-station at Potterhill for the Corporation,

Paisley. — HOUSE.—Plans passed: Double house at Dalmeny-drive, for Robert Walter C. Keith.

Dunfermline. — HOUSES. — The T.C. considered a recommendation by the Housing Sub-Committee to carry out re-housing schemes at West Netherton, Forth-street; the schemes will probably provide for the erection of between forty and fifty houses.

Alloa.—PAVILION.—The Dean of Guild Court has passed plans for a pavilion proposed to be erected at the workers' sports ground at Tullibody, for Messrs. Patons & Baldwins, Ltd.

Edinburgh.—HOUSES.—The T.C. has decided to erect four demonstration steel houses at Gorgie, at a cost of £450 each.

Cupar.—ROOM.—The Trustees and Managers of the Cupar Savings Bank lodged a petition for the erection of a new room for the Actuary at the rear of the present premises in Crossgate, on the ground floor level. The Dean of Guild Court passed the plans.

HOUSING PROGRESS IN SCOTLAND

THE following figures show the progress that has been made in State-aided housing schemes in Scotland to October 31, 1924:—

	Completed.	Under construction.
1919 Act	22,969	2,457
Private Subsidy Schemes	2,324	—
Slum Clearance Schemes..	752	2,004
1923 Act	917	5,009
1924 Act (Local Authority Schemes)	—	232
	26,962	9,702

Of the total number of houses completed and under construction under the 1923 Act, 1,975 are by local authorities and 3,951 by private enterprise.

* These prices apply to *new buildings only*. They cover superintendence by foreman and carry a profit of 10% on the prime cost without establishment charges. A percentage of 1½ should be added for Employers' Liability and National Health and Unemployment Acts and from 1s. 6d. per £100 for Fire Insurance. The whole of information given on this page is copyright.

NEW BUILDINGS

—A large site in Barnet Hill and the dings, comprising the late Victoria Hospital, have recently changed hands, ding operations are projected. The buildings are to be converted into flats or four rooms each, whilst on the rontage, which stretches for about vill be built a row of shops and flats. hitect is Mr. Herbert J. Axten, A., of Enfield, Middlesex. The builders rs of the property are Messrs. Hayward t, Chesterfield Estate Office, East , London, N.2.

—A new music school is being erected School, on a site adjoining the Temple Rooms in Hillmorton-road, Rugby. ns show a building of three stories, ted of brick, on a steel framework, with tal stone copings and cills to the on the principal elevations. The roof itched and covered with slates. Inside school will be arranged twenty-four practice rooms, four general class- ther rooms for teaching, stoves, &c. itect is Sir Charles Nicholson, Bart., -square, Lincoln's Inn, London, W.C.2. lers are Messrs. Wooldridge & Simpson, hay-road, Oxford.

ith.—The Great Western Railway Co. to inaugurate shortly an extensive cheme for the benefit of their employees outh. A site of 7½ acres has been and a plan on similar lines to the schemes at Acton, Hayes, Bristol and ntres, being carried out by similar local has been adopted. The houses will rious types, comprising living rooms, three bedrooms, bathrooms, &c., and hree bedrooms, bathroom, &c. Erected they will be built of facing bricks and gings and cement with rough-cast cream. The roofs will be of hand- es. The architect is Mr. T. Alwyn .R.I.B.A., of Cardiff, architect to the own Planning and Housing Trust, Ltd.

—Lloyds Bank, Ltd., intend to build ranch bank at Bristol, and about twelve ago bought a site in Corn-street from tol Corporation. Work has recently ed upon a stone-faced building, erected l frame, to the designs of Messrs. Waller architects, of 17, College Green, r. The builders are Messrs. W. T. Ltd., of St. Paul's-road, Gloucester.

ool.—A large shopping emporium is lt in Church-street, for Messrs. Montague Ltd., wholesale clothiers, of London ds. The new building will be of five with extensive basements, and will on a steel framework, with its principal n Portland stone. The roof will be flat, reed concrete, and an outer covering of oofed asphalte. The floors will all be of d concrete—B.R.C. fabric being speci- e interior fittings will all be in mahogany r hard woods. A lift will be installed. namental display windows will front on t on the ground floor. Central heating tric lighting will be installed. The ontractors are Messrs. William Moss & l., of Roscoe-street, Liverpool, Lough- and London. The steelwork is being and erected by Messrs. Banister, Co., Ltd., of Trafford Park, Manches- architect is Mr. Harry Wilson, of 12, Park-avenue, Kirkstall, Leeds.

er.—An interesting housing scheme is ried out at Leicester by the trustees of Mr. W. R. Sutton, which will consider- to solve the city's housing problems. state in Gipsy-lane, covering an area 20 acres, has been purchased, and e been prepared for the erection of es of various types. The dwellings f five and six bedrooms, and will be nly in pairs and blocks of fours. Bricks ncipally used, whilst some of the houses artially rough-casted. The roofs will The scullery floors in each case will be covered with quarry tiles, whilst the other floors will be of wood, the ground floors being laid on concrete. Ranges of a modern type will be fitted in each kitchen, with hot water boiler. The contractor for the road and sewer works is Mr. G. H. Greasley, of St. Leonards-road, Leicester, but contracts for the houses have not yet been placed. The architects to the Trustees, whose offices are at 183, Old-street, London, E.C.2, are Messrs. Cowdell & Bryan, of New-street, Leicester. The quantity surveyors are Messrs. Widnell & Trollope, of Broadway-court, Westminster, S.W.1.

Surrey.—Plans are being prepared by Mr. Sydney Tatchell, F.R.I.B.A., of Bank Chambers, 32, Strand, London, W.C.2, for the erection of a new tuberculosis sanatorium at Milford, in Surrey, for the Surrey County Council. The first part of the scheme will provide accommodation for 200 patients, with facilities for extensions, if necessary, up to 300 beds. The buildings proposed will include administrative block, which will be big enough to serve an institution of 300 beds, officers' block, nurses' quarters, engine house, and wards. Later there will be added a medical officers' residence, mortuary, &c. The scheme will provide for brick buildings, with fireproof floors and a tiled roof.

Hendon.—A new church of St. Alphage is to be built at Colindale, N.W., in connection with the Bishop of London's scheme for the removal of some of the City churches to more residential and useful centres. This church will be built from funds derived from the sale of the site of St. Alphage Church in Aldersgate, E.C.2. The new edifice will be erected in brick with stone facings. Electric light will be used for illumination, and heating from a low-pressure boiler will be installed. The roof will be slated or tiled. All interior woodwork will be of English oak. The architects are Messrs. Nicholas & Dixon-Spain, FF.R.I.B.A., of 19, Hanover-square, London, W.1.

Wimbledon.—A block of three-story buildings is being erected in Arthur-road, S.W., to be used as shops and showrooms. The site has a frontage of about 50 ft. The buildings will be built of brick with a certain amount of stone work for window cills and jambs, &c. The roof will be flat and covered with asphalte. Electric lighting will be installed. The window casements will be of wood. The plans have been prepared by Messrs. Edward H. Wilkins & Gripper J. Bell, 28, Victoria-street, Westminster, S.W.1. The contractors are Messrs. James Burgess & Son, of Wycliffe-road, South Park-road, Wimbledon, S.W.19.

TRADE NEWS

Messrs. Walworth-Munzing, Ltd., 90-96, Union-street, Southwark, S.E. 1, have sent us a copy of their wrought-iron tube and fittings' list. They will be glad to send this useful publication to all interested.

We have recently received from Messrs. The Blick Hygienic Dish and Clothes Washer, Ltd., London, a descriptive pamphlet of their well-known combination. It has a triple capacity, for it will not only wash and dry dishes, plates, &c., but, by an interchange of two fittings, the machine becomes an efficient clothes washer. It entirely supersedes the old-fashioned gas copper, which served one (and only one) purpose.

We have received from Messrs. Harris & Sheldon, Ltd., 46, Cannon-street, E.C. 4, a copy of their new catalogue of British-made steel furniture. At the time when steel is not only superseding wood, but many other forms of material, it is as well to bear in mind the advantages which steel possesses. It is permanent, and does not warp, burn, rot or shrink. Sankey-Sheldon steel furniture is, it is stated, fire-resisting, damp and vermin proof, washable and hygienic. For practical utility, combined with its own form of artistic finish, steel buildings and furniture are well worth consideration.

TENDERS.

—No. 4270. DECEMBER 5, 1924.

HOUSING SUGGESTIONS

HE articles which we have recently published on housing, and the articles and correspondence which have appeared elsewhere, all point to the conclusion, which many must have long reached, that the production of houses, like everything else, must, to essful, eventually return to a business basis untrammelled ical considerations. This, at least, we hope Parliament and we hope consideration will now be given to the f all those in the building industry who are chiefly ed in the production of houses. For some years we estioned the policy pursued by the governments of the d have expressed the belief that the problem has not lly considered in the light of the experience of the onal and business interests concerned, and that the ve proposals for dealing with the acknowledged diffi- nherent in the problem which are frequently made in ly and technical press do not appear to receive the ation they deserve. One such suggestion is made by nown architect, who writes as follows :—" One is almost l to suggest that it would be the best policy to allow rise to an economic value at present building prices et the inevitable demand for enhanced wages which ollow and which would at least be spread over the nity at large and would probably cost no more than s and officialism. Such a course would, at least, te housing from politics." During the exceptional tances of the war, tampering with the laws of supply nand was no doubt necessary, but this is no reason why ld attempt to make this disastrous proceeding part neral policy in normal times. Under present conditions ate return to an economic basis is doubtless impossible, s our attitude towards housing not suggest that we are ur individuality and becoming too dependent on collective action ? Great schemes are very laudable, but carry nem great delays, much political complication, and sm. We venture to submit that it is time we honestly cts. There are not enough operatives in the building go round, and the small difference between the wage killed and unskilled worker is reducing the former class. n great demand the operatives are making us directly irectly pay for their services at as high a rate as possible ss of housing or anything else, and will continue to do the public cannot afford more and demand consequently . This may not be agreeable, but markets have been l before and will be again. Those who have sat on ring committees know that the cost of materials, on paper it may be otherwise, actually cannot be d by government control, but will continue to e laws of supply and demand. In these circum- can any uneconomic State building scheme hope to ?

l normal conditions are restored can we not revive ng of the old colonising spirit and try to help ourselves ? all events, is another suggestion, which has been made by laymen, but by people interested in the building and though it would not deserve consideration in times, as a temporary expedient for dealing with our es it may be worth trying. During the war it essary to put people into all kinds of new positions, and those with experience of such efforts know how exceedingly difficult the process was, but they also know in what a very short time anybody of ordinary physique and intelligence could be trained to do a limited piece of repetition work, even though that work itself was not very simple, and we have been asked : " Why should not our technical schools throughout the country undertake to train some of our unemployed in a very limited section of work necessary for erecting, say, a one-story cottage, possibly of timber for preference, as being easy to erect and free from monopolies ? These men would offer their services in teams arranged by their school. They would not call themselves, or be, building trade operatives, but would be given a certificate for proficiency in the small sphere of work on which they had been trained. They would be paid a fair wage, and would be responsible to the team leader who might in many cases be a man possessing some kind of useful previous experience. Such a scheme would, of course, have to be administered, but for a simple standard house of the primitive type this should not be difficult and might provide very suitable work for some of our ex-officers, particularly engineers, to whom we still owe a national debt. Materials could be supplied and bought, as far as possible cut and marked, ready for erection, in the cheapest markets. If any form of bonus on cost could be arranged without inviting scamping, it would be a valuable incentive to keeping down the price of these houses. The success of any such scheme would necessitate the entire exclusion of building by-laws and officials who live by their interpretation, apart from the bare requirements of health. The existing housing organisation could be usefully employed in this scheme upon questions of land and roads, and if it be objected that these houses would not be permanent, they might be confined to leasehold land on terms which would admit of their replacement when the next generation has developed saner views on economics. Under this scheme it should be possible, with perhaps the aid of some loan at low interest, for many in need of houses to form their own teams and erect a few houses between them, and even those in employment could do much in this direction during the summer months with the assistance of a versatile administrator to help such personal efforts."

The effect of such a scheme upon the unemployment problem should be considerable and lead to the absorption of many men suited for outdoor work without the necessity for transference to great distances as the need for houses is so widespread. Such a scheme would considerably augment the available supply of labour for housing, and those already in the building trade, having regard to the great arrears to be made up providing for more work than the trade can tackle, would hardly object to this effort to make provision for the worker. Further, we think that a great many ex-officers, to whom we owe a debt still undischarged, might be, as suggested above, brought into this scheme as administrators. We are aware of the Australian experiment upon short-time training for operatives in the building trade and the statement that this is being brought before the Minister of Health (see p. 886). So many fruitless efforts at dilution have, however, been made that we think this suggestion for independent action is worth considering. Will our Technical Schools—those with building courses taking the lead—get together on the matter and, if thought feasible, approach Mr. Neville Chamberlain ?

NOTES.

Manchester Architecture.

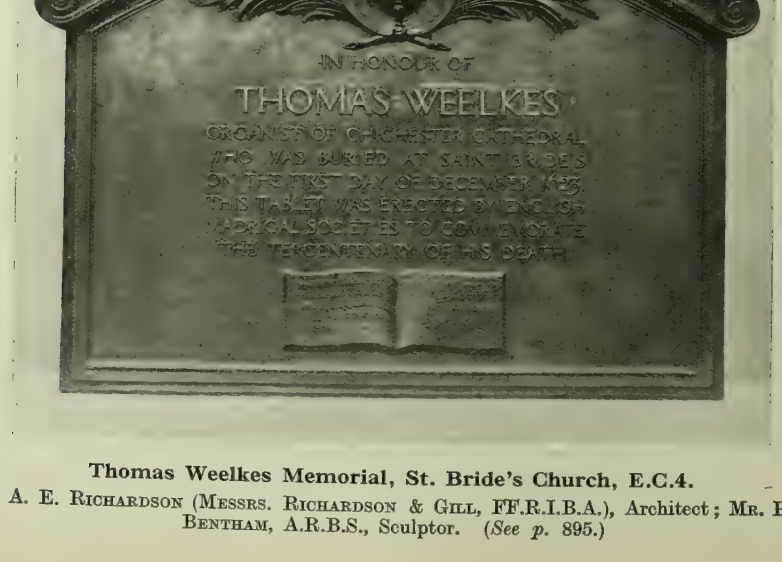
We must all welcome the interesting and informing essays on the architecture of our towns which have appeared in various papers from the pen of Professor Reilly, for his treatment of the subject seems of a kind likely to appeal to the cultured public. The *Manchester Guardian* enlisted his services in regard to Manchester, and the result is before us in a small volume.* Frankly, we think the discernment of the author has not been able to point to enough work of good quality to give Manchester citizens much cause for satisfaction in the record he has been able to make of her contributions to the art of architecture. Manchester is not, of course, so fortunate in her lay-out and development as Liverpool, which can show much that is attractive and something that is fine in many of its streets and open spaces. Manchester has its Piccadilly, which might even yet be made a striking and pleasing open place; and round about the Cathedral and railway stations the expert city planner could some years ago have directed the foundations of something worth having. Since we have known it, some of the Manchester thoroughfares, such as Market-street, seem to have deteriorated; and Deansgate is nothing like so good in its general aspect as one might have expected it to become. Of the one typical and striking example of a Manchester warehouse we have a rather inadequate illustration, but the subjects of the best sort are of somewhat ancient date, as the Bank of England, the Free Trade Hall, and the Art Gallery. Williams Deacon Bank, the Rylands Library, and the Opera House, uphold the credit of modern work, but the record of architecture in Manchester as presented in this book suggests how much this great city has missed in comparison with what such cities as Glasgow, Edinburgh and Liverpool are able to show.

* Some Manchester Streets and their Buildings. University Press of Liverpool. 5s.

Quick-Hardening Cement.

There has been an increasing demand recently for a cement which will set more rapidly than the Portland cements to which we have become accustomed, and cement chemists have for some time been experimenting with a view to the production of a quick-hardening cement at a cost which will not be excessive for the general requirements of the builder and engineer. So much progress in this direction has now been made that a new quick-hardening Portland cement is being put on the market, and tests so far undertaken by Professor Dixon at the City and Guilds Engineering College go to show that a considerable measure of success has been achieved. The tests, which are reported on p. 909, have so far only been undertaken up to the age of 7 days, but as they prove that at 48 hours the new cement has a greater strength than required by the British Standard Specification at 28 days, there can be no doubt as to the rapidity of hardening. Whether this strength will be maintained over a long period of years time alone will tell, but as it is a true Portland cement there can be no reason to expect anything but an increase of strength with age. Up to 28 days a completely satisfactory increase is indicated, and we hope to give the results of the 28-day tests, with some fuller particulars, later.

Sculpture on Buildings.



Are we right in assuming that one of the keenest critics of Mr. Epstein's figures on the Medical offices in the Strand is now objecting to their suggested removal? This sculpture was a striking example of Mr. E power, and added something of and vitality to Messrs. Adams & H building, so why should it be r when the fright of the critics has a The figures may not appear to particularly comfortable setting, dom does sculpture appear to be comfortable and valuable additi building, because architects and s do not often work together in an sympathetic way.

Building Trade Dilution.

The officials who are sible for advisin Government on the problem are, we formed, reading this week a repo committee appointed by the Builders' Association of New South which gives details as to the succe scheme for intensive training for layers and plasterers instituted las A similar scheme is under consid for this country, and the replies fro education authorities that hav received by the Board of Educatio that in the majority of cases te schools in England and Wales may be used in order to provide the in labour needed for housing. Acco the report of the Sydney experime special interest. Preference for was given to returned soldiers and b labourers. At the end of a 13 course students were tested as number of bricks they could lay i hours on a plain straight 9 in. wal average of students up to 21 year was 911 bricks, while the averag students aged between 26 and 1,077. After 30 years of age the decreased. Plastering was also with satisfactory results. It sh noted that the trainees were select as possible from those who had r engaged in the building trade, a bricklayers and others who are outside working conditions. It is in the report that "these result conclusively that the idea that must be learned between the age o 21 or not at all was a fallacy, an man who has realised the value o a skilled trade at his command made up his mind to learn can do quickly than a boy who has not l school and who has not realised t of learning a trade.

Plumbers and Housing.

There is much r building quarters postponement of a ence of the repres of the plumbing industry—a trad tial to the success of the Gov housing policy—that had been su to meet on Thursday at the I Education. It is feared that th pected postponement means that a danger of the failure of a natio that was being made to raise th standard of craftsmanship in the

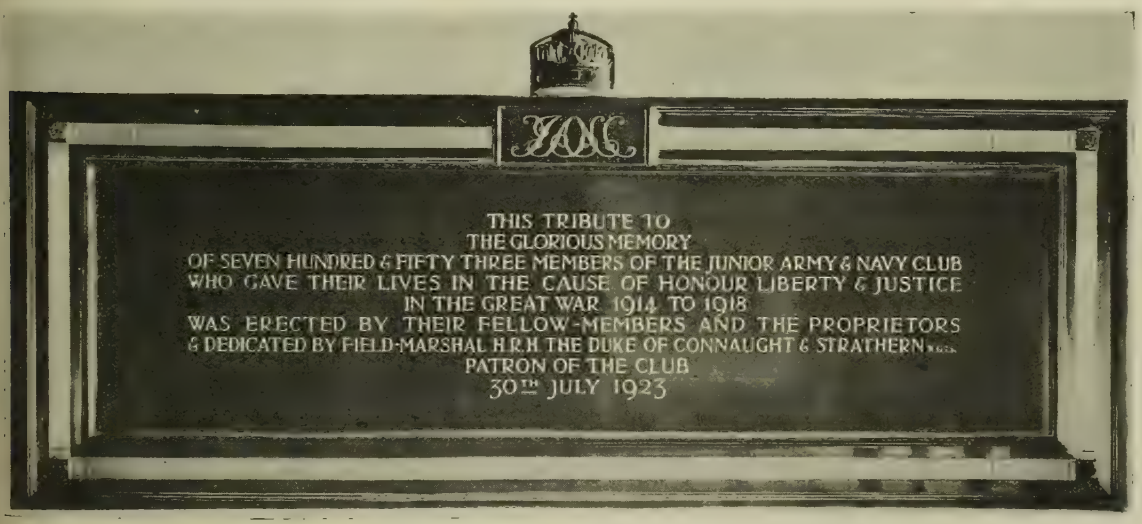
. This is far more than an industrial ion, for efficient plumbing is essential e health of the nation. This fact has s been recognised by Mr. E. Lesser, rly of the Ministry of Labour, and Chairman of the Plumbing Trade's nal Apprenticeship Council, and his gues, Mr. W. D. Caröe, F.R.I.B.A., of Worshipful Company of Plumbers, . Porter, the Royal Sanitary Insti- Mr. H. D. Searles Wood, F.R.I.B.A., R. S. Clay, D.Sc., of the Association chnical Institutions, and Mr. Hugh es of the Board of Education. The cil, on which sit six master plumbers ix operative plumbers, as well as the sentatives of associated interests, has d out a far-reaching scheme in order in every plumber to be a true crafts- and to eliminate bad work. Pro- s are under consideration for the tion of Provincial Local Councils to employers to see that all appren- have a thorough grounding in the ical processes of the craft, and to rage attendance at technical schools. sudden breaking off of the Confer- arranged for Thursday is causing much anxiety among those who consider that efficient training is essential for the success of any housing policy.

The late John Slater.



The death of Mr. John Slater, F.R.I.B.A., will be heard with much regret by many of our readers, especially those architects of the older generation who remember the prominent position he occupied in the profession and the interest he took as a young man in the Architectural Association, and subsequently the Royal Institute of British Architects. He was a worthy President of the A.A. in 1887, and though he did not serve the Institute in that capacity he became a Vice-President in 1900–4 during which period and subsequently as member of Council his sound judgment and wide experience were made full use of. For some years he was the architect member of the Tribunal of Appeal under the London Building Act, while he will be remembered as Surveyor to the Berners Estate in London, which position he held for many years. He will long be remembered as a very able man whose standard of professional conduct and high sense of honour had won for him the regard of all who knew him. We give some notes of his career on p. 888.

A New Garden Suburb.

The most promising source of new houses is the energetic Public Utility Society, and it is gratifying to note that a new one of considerable magnitude is to undertake the development of an estate of 123 acres at Streatham. The ordered development associated with such a society is a guarantee that the natural beauties of the area, which is adjacent to Streatham Common, will be considered and safeguarded. The formation of such societies depends upon the driving force of men of energy and determination, and if such men could be persuaded to come forward in other districts, until these societies were the rule rather than the exception, our housing troubles would begin to evaporate.

Women and Housing.

May we hope that the very representative meeting of the Women's Housing Associations recently held at Westminster may herald the approach of a wider and saner public attitude towards the solution of our housing difficulties? Politics have been the bane of the past. They have encouraged foolish panaceas, aroused false hopes, provoked suspicion, and favoured delay and exploitation. Women are notoriously free from definite political labels, and they are at the same time strongly susceptible to problems of direct home importance. Ruskin once said that if women combined they could prevent war; this theory may or may not be acceptable, but if they combined they could unquestionably solve the housing problem, or, which would be just as effective, see that it was solved by someone.

GENERAL NEWS

Oldswinford Church.

The restoration committee and the church council of Oldswinford Church have definitely dceided to adopt the scheme for the restoration of the tower and the rebuilding of the nave of the church according to the plans drawn up by Sir Gilbert Scott, R.A.

Change of Address.

The address of the proprietors and editorial office of Concrete Publications, Ltd. (*Concrete and Constructional Engineering, The Concrete Year Book*, and "Concrete Series" of books) has been changed to 20, Dartmouth-street, Westminster, S.W.1. (Telephone: Victoria 4581.) The Publishing Office remains at No. 4, Catherine-street, W.C.2.

The Late Sir Thomas Jackson.

The Royal Academy has arranged a memorial service to the late Sir Thomas Jackson, Bart., R.A., on Monday, December 8, at 2.30 p.m., at St. James' Church, Piccadilly.

Glasgow School of Art.

The governors of the Glasgow School of Art have appointed Mr. John D. Revel to be Director of the School, in succession to the late Mr. John Henderson. Mr. Revel is at present headmaster of the Chelsea School of Art, a position he has held for the last twelve years.

Brick-making Industry.

New rates of pay and conditions are to be paid to boys and youths engaged in brickmaking in the northern section of England from December 1. According to the arrangement made with the Northern Conciliation Board, the scale is based on the payment to boys 14 years of age of 4½d. per hour, with an increase of a halfpenny at the end of every six months until 21 years old.

Rating and Income Tax.

A very interesting and timely article on the rating of tenements and flats appears in the issue of November 29 of *Rating and Income Tax*. The article is written by Messrs. Albert Crew and W. T. Creswell, Barristers-at-law, and will be of assistance to all who will be engaged in valuation in connection with the forthcoming Quinquennial in London, or in rating generally. Further subjects of interest to property owners in the same issue are an article on the proceedings of the London Assessment Conference in connection with next year's Quinquennial, and an examination of the form of Statutory Form required at previous Quinquennials, a comparison of it with the return being issued for 1925, and a clear indication of the manner in which the form has been modified.

Middlesbrough Technical College.

In 1916 Sir Joseph Constantine presented Middlesbrough with £40,000 to meet the cost of erecting and equipping a technical college. The authorities, however, found that the amount was not nearly sufficient to cover the cost of a really representative college. The widow and family of the late Sir Joseph Constantine, and Mr. William Constantine, senior, have now intimated their willingness to augment the original gift to a maximum, including interest, of £80,000. With the contributions of £10,000 each promised by Messrs. Dorman, Long & Co., Ltd., and Messrs. Bolckow, Vaughan & Co., Ltd., together with other bequests, the committee are in the position, we understand, of being able to invite immediate competitive plans on the original basis, as noted under "Competition News" in our last issue.

South Wales Institute of Architects.

A meeting of the South Wales Institute of Architects and members of the South Wales Builders' Associations were addressed recently, at Cardiff, by Mr. T. Pierson Frank, the Cardiff City Engineer, on "Recent Changes in By-laws Relating to New Streets and Buildings." Mr. J. E. Turner, J.P., F.I.O.B., presided. Mr. Frank dealt with the draft of the new Cardiff by-laws now awaiting sanction of the Ministry of Health, under which are to be permitted several departures in building construction in the matter of walls interdicted before. One clause would permit the construction of arcades. He dealt also with the general advantages obtained in the matter of estate development by the town-planning regulations with regard to new streets.

OBITUARY

We regret to announce the death, at the age of 77, of Mr. John Slater, F.R.I.B.A., Born at Bishops Stortford, Mr. Slater was educated at the Collegiate School, and University College, London. In 1878 he was articled to Professor T. Roger Smith. From 1887–8 he was President of the Architectural Association, and Vice-President of the Royal Institute of British Architects from 1900–4. Mr. Slater was a Member of the Tribunal of Appeal, London Building Acts, and was well known for his activities as an arbitrator. He was responsible for many important business premises, and apart from his numerous lectures found time for a considerable amount of literary work, including A Short History of the Berners Estate, and Classic and Early Christian Architecture, with Professor Roger Smith.

The death of Mr. John William Dennison, of Eastbourne, removes the oldest member on the Rolls of the Royal Institute of British Architects. Mr. Dennison was elected an Associate over sixty years ago and was promoted to the Fellowship fifty-three years ago. He retired from practice in 1899.

We regret to announce the death of Mr. E. J. Kibblewhite, a former editor of *The Building News* and *The English Mechanic*, at the age of 77 years. Mr. Kibblewhite retained his connection with those journals until so recently as September, 1923, when he retired. Mr. Kibblewhite had a lifelong experience of journalism, chiefly in connection with the enterprises of the late Passmore Edwards, and was for many years editor of *The Weekly Times*. He was also one of the founders of the Society of Architects.

MEETINGS

FRIDAY, *December* 5.

Trades Training Schools.—Prize Distribution. At Carpenters' Hall, London Wall, E.C. 7.45 p.m.

MONDAY, *December* 8.

Royal Society of Arts.—Mr. L. C. Martin on "Modern Colour Problems." 18, John-street, W.C.2. 8 p.m.

TUESDAY, *December* 9.

College of Estate Management.—Mr. C. Dalgliesh on "Rating of Special Properties and Public Undertakings." At Lincoln's Inn Fields, W.C.2. 5.30 p.m.

Liverpool Architectural Society.—Mr. J. E. Marshall on "Permanency in Building." At 13, Harrington-street.

Institution of Electrical Engineers.—Mr. T. Hall on "Domestic Application of Electricity." At the Town Hall, Leicester. 6.45 p.m.

THURSDAY, *December* 11.

Architectural Association.—Conversazione. At 34, Bedford-square, W.C.1. 8 p.m.

London Master Builders' Association.—Annual Dinner. At Hotel Cecil, Strand, W.C.2. 7 p.m.

Society of Antiquaries.—Sir Martin Conway on "Present Condition of Works of Art in Russia." At Burlington House, Piccadilly, W.1.

COMPETITION NEW

Hamilton War Memorial.

THE assessor in this competition, Mr. A. Paterson, has made the following aw (1) Mr. T. Harold Hughes, A.R.I.B.A Ashton-terrace, Glasgow; (2) Mr. V H. Gregory, A.R.I.B.A., 7, Appletree St. James's-square, London; (3) M Heiton & McKay, 72, George-street, E (4) Messrs. Orphoot, Whiting & Bryce Alva-street, Edinburgh. The designs w exhibited in the Public Library from D ber 6–13.

Ross-Smith Memorial.

The design of Mr. F. B. Hitch, sculpt London, has been accepted in this compet

Designs are invited for a wall tablet placed in the large hall of the King Henry School, Coventry. Sending-in day, Decemb Full particulars from the Headmaster. advertisement this week.)

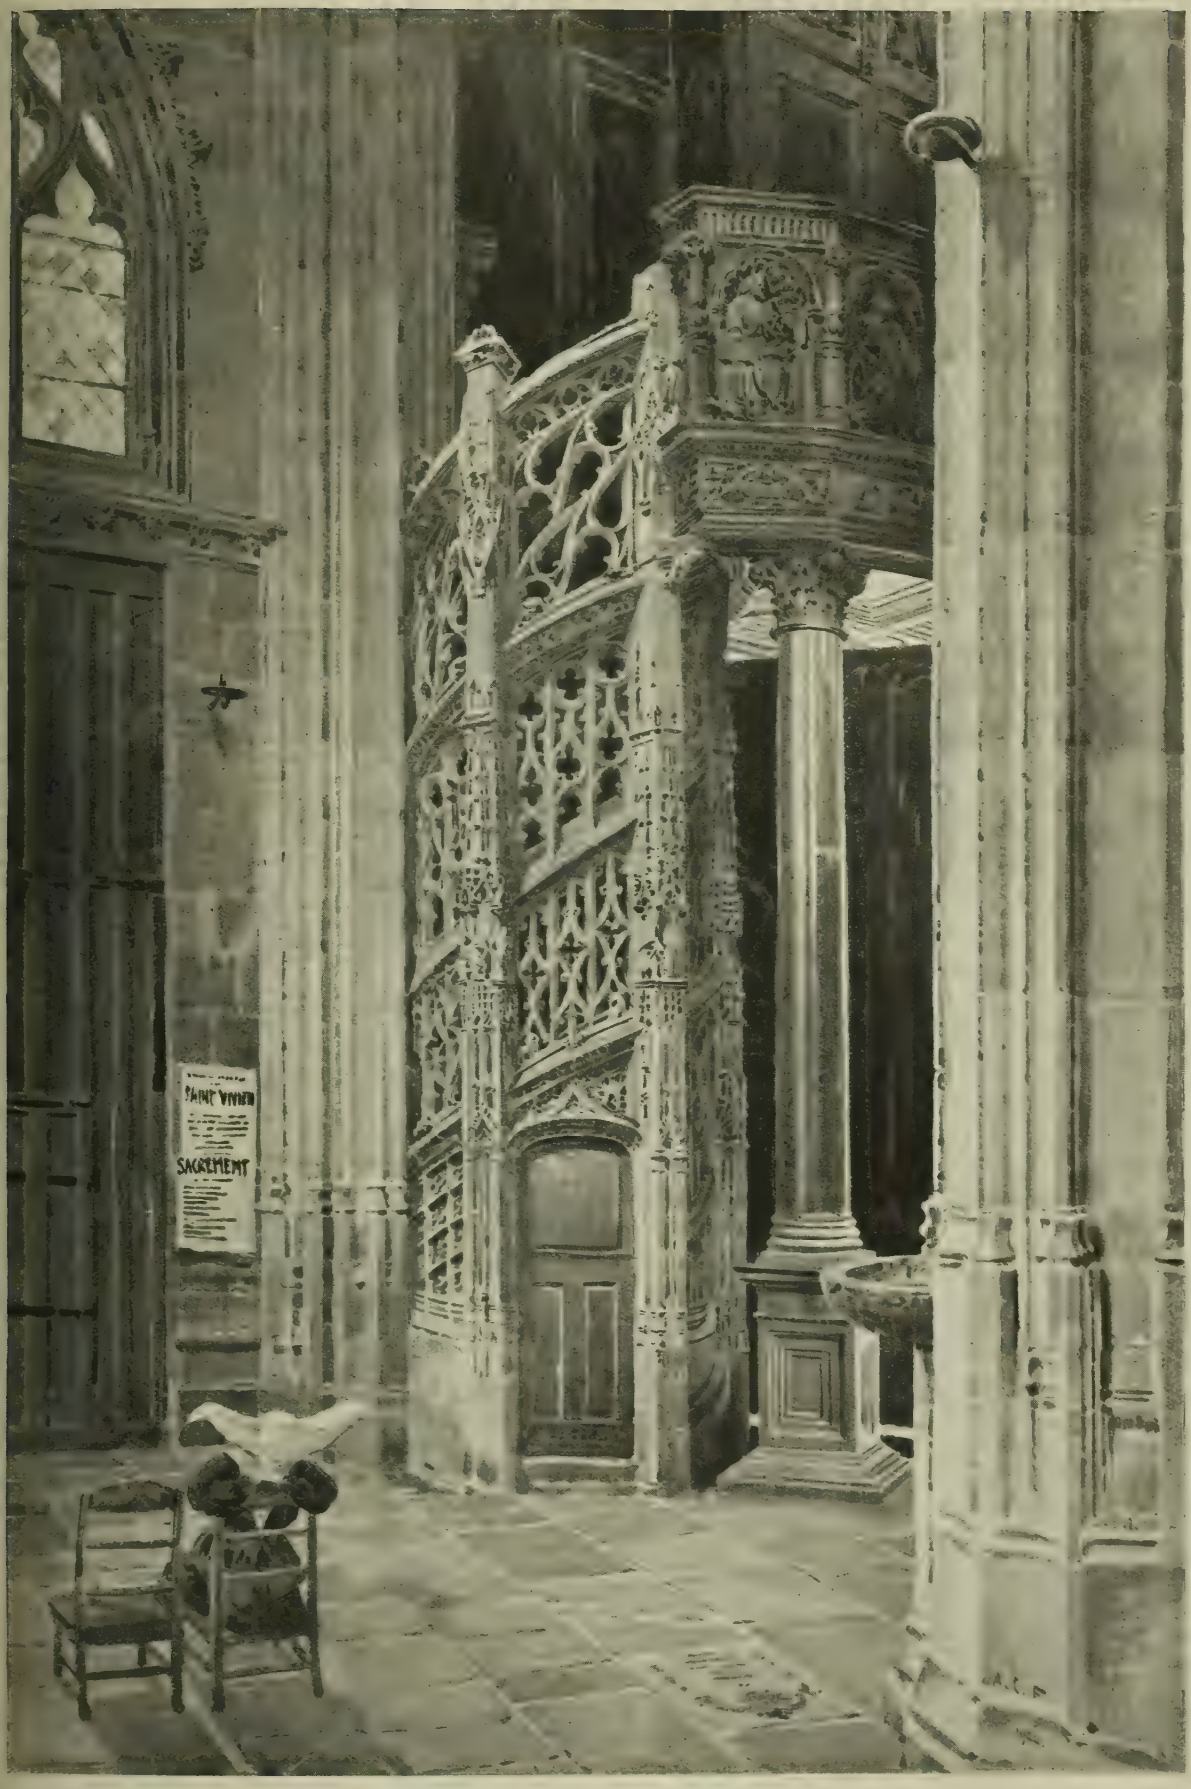
Leeds Library.

Designs are invited from architects in Riding only for a library to be erected a Compton-road estate. Mr. Percy S Wort ton, F.R.I.B.A., is the assessor; premiums £20, and £15. Conditions, on the payme £1 1s., from the Town Clerk, Leeds Sendi day February 16, 1925.

Modern Methods of Ventilation.

For an essay on "The Ventilation of a Court," a silver medal will be awarded b Worshipful Company of Fan Makers. our issue for November 28.)

Valletta Lay-out Competition.



Designs are invited for the lay-out o open spaces and fortifications between Va and Floriana and those encircling Flo Applications for particulars, with a depo £5, to be made to the Minister of Public W Public Works Office, Valletta, Malta, not than December 1. Premiums of £1,000 and are offered to the first and second compe respectively. An indemnity of £100 w awarded to three other designs showing spicuous merit. Sending-in day, June 30, Conditions can be seen at this office. assessors in this competition are Mr. Warren, F.S.A., F.R.I.B.A., and Pro Patrick Abercrombie, M.A., A.R.I.B.A.

Other Competitions.

Other competitions still open include th lowing (the dates given are, first the send date, and second the issue of *The Build* which full particulars were given):—M Hall (May 1). Manchester Art Gallery 28; Aug. 22). Offices at Nairobi (Feb Nov. 7). Jugo-Slav Landscape (Dec. Nov. 7). Church at Southport (no send date; Nov. 7). Southend School (Dec Nov. 14). Argentine Institute for the (Dec. 31, 1925; Nov. 28).

Smoke Abatement.

Representatives of sixty-six local auth in the Manchester and district town-pl area, following a requirement by the M of Health, met recently in the Manchester Hall, under the chairmanship of the e Mayor (Alderman W. T. Jackson), to a a committee to bring about a uniform a strative system in connection with abatement. Sixteen members were app with the addition of Alderman Jack chairman and Dr. Veitch Clark, the Man Medical Officer of Health. The Mini Health hope that uniformity in reg penalties and the degree of restrictions introduced.

Staircase to Organ, S. Maclou, Rouen.

Sketch by MR. A. C. FARE, A.R.I.B.A.

THE "QUEEN MARGARET" STATUE AT LINCOLN CATHEDRAL

By JOHN L. HODGSON, M.I.Mech.E.

In the following article the writer gives a brief account of Queen Margaret, who was the second wife of Edward I. He also describes a mediæval portrait statue of her, which, owing to its inaccessible position, and to the belief that the head was a reconstruction, has been previously overlooked.

* * * * * *

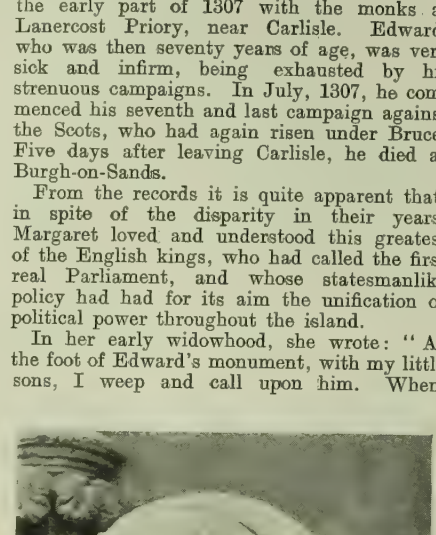
After the death of Edward's first wife, Eleanor, in 1290, the erection and endowment of the famous Eleanor Crosses (these were used as outdoor preaching places, and also for the distribution of alms according to their several endowments. The records show that they were paid for by Eleanor's executors! The only ones that remain are at Northampton, Geddington, and Waltham) and the other ways of perpetuating her memory which the Church devised, did not for long fill the gap in Edward's life which the loss of a wife's companionship had made. In the words of the monk, Piers of Langtoft:

"His solace all reft, sith shè was from him gone,
On fell things he thought, and waxed heavy as lead,
For sadness him o'ermastered, since Eleanor was dead."

We, therefore, find Edward in 1293 corresponding with Philip le Bel, King of France, for the hand of his sister, Blanche la Belle, then aged twenty-two, and reputed to be the most beautiful woman of her time. A treaty was drawn up, whereby Gascony was to be given over for ever in return for her hand. Philip in due course took Gascony. In the meantime, however, he found that it would be possible to marry Blanche to Rudolph of Hapsburg, the eldest son of the Emperor Albert I. He, therefore, proposed that Edward should marry Margaret, the younger sister of Blanche, who was then a mere girl of thirteen.

Edward immediately went to war, and it was not until 1298 that any pacific arrangement was come to between him and the French King. Peace was facilitated by the fact that while Edward and Philip fought, Margaret grew up, and gave promise of even greater beauty and grace than her famous sister Blanche. In his chronicle, Piers describes her as

"Dame Marguerite, good withouten lack."



It was thus that on September 9, 1299, Margaret was married to Edward in Canterbury Cathedral by Robert of Winchelsea; she being in her eighteenth and Edward in his sixty-second year. There was no time for the new Queen to be crowned, as within a week, Edward, in spite of the opposition of his barons, started on his third campaign against the Scots, who were recovering from the defeat he had inflicted upon them at Falkirk in 1298.

During his absence in Scotland, Margaret resided at the Tower. She was practically under quarantine; as smallpox, brought back by Edward's men from his crusade in Syria, was ravaging the city of London. After this first summer, Margaret either accompanied Edward on his campaigns against the Scots, or, when this was too dangerous, kept court in one of the northern counties, notably at Cawood Castle, near York. Always a keen sportswoman, her first son, Thomas, was born at a house in Brotherton while she was away from Cawood following the chase in the forest which then lined the banks of the Wharfe. In the winter, 1305-1306, there were, following upon the execution of Wallace and the apparent subjugation of the Scots, great festivities at Westminster, in which the young Queen joined.

Margaret and Edward spent Christmas and the early part of 1307 with the monks at Lanercost Priory, near Carlisle. Edward, who was then seventy years of age, was very sick and infirm, being exhausted by his strenuous campaigns. In July, 1307, he commenced his seventh and last campaign against the Scots, who had again risen under Bruce. Five days after leaving Carlisle, he died at Burgh-on-Sands.

From the records it is quite apparent that, in spite of the disparity in their years, Margaret loved and understood this greatest of the English kings, who had called the first real Parliament, and whose statesmanlike policy had had for its aim the unification of political power throughout the island.

In her early widowhood, she wrote: "At the foot of Edward's monument, with my little sons, I weep and call upon him. When

Three-quarter View of Head and Bust.
(Note the sensitive modelling of the mouth and chin.)

Edward died, all men died for me." (John O'London's Chronicle.)

Margaret survived Edward by only ten years. She died at Marlborough Castle, on the border of Savernake Forest, at the early age of 36, and was buried in the Church of the Grey Friars, near Newgate, of which she was one of the founders. (She began the choir in 1306, and finished it during her widowhood.)

The English chroniclers relate nothing but good of her. She frequently tempered the King's harsh judgments; notably in the case of the city of Winchester, whose charters Edward had forfeited. At times, when she felt her own unaided skill might fail, she would send her young children to plead the cause she had espoused. While she lived, she was an influence for good in the unhappy lives of Edward II and Isabella his queen.

Such is a brief account of Queen Margaret and the troublous times in which she lived.

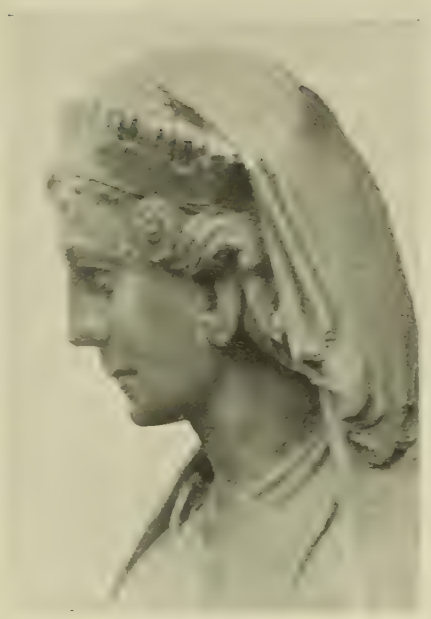
* * * * * *

The writer recently, after an absence of some twenty-five years, re-visited Lincoln Cathedral, which he had known and loved as a schoolboy. While at Lincoln, he came across a photograph of the statue, that, according to tradition, represents Queen Margaret. This statue, which is in a niche on the right-hand side of the south "Judgment" porch of the cathedral, level with the roof of the Russell Cha can only be imperfectly seen from the grou According to various guide-books, and to Messrs. Prior & Gardner, whose book the accepted authority on mediæval fi sculpture, the head of the statue has b restored, and the figure is of no g interest.

The photograph above referred to, wh was taken from the roof of the Russell Ch when some scaffolding was erected in 1 seemed to the writer to reveal a very differ state of things. The amount of weather of the head could be seen to be about eq to that of the lower part of the figure, this could be definitely dated as being p to 1480 by the chisel marks of the ma who had hacked part of it away in order put the last battlement of the chapel i place.

Further, the treatment of the head show several strange features, such as the be out ears, which were not likely to have b invented by a nineteenth-century renovat and the whole texture of its composition w such as only the late thirteenth or ea fourteenth century could have produced. T statue, in its grace of pose, and the vig and freedom of its treatment (usually mediæval sculptor had no freedom at when filling in important spaces; he had design set figures, or groups of figures, the instruction and edification of an unl tered public, all the main features and acc sories of which were carefully specified his employers, the priests), seemed to an amazing piece of work, even for period 1290-1310, to which it obviously longed. The writer, therefore, approach Dean Fry for permission to take photograp and make drawings and measured sections the statue, and also to copy the he This request, having been granted at meeting of the Chapter, the necess scaffolding was erected at the beginn of September last. The accompany photographs, which were taken for writer by Mr. S. Smith, the official cathed photographer (who took the original pho graph in 1908), show the beauty of the stat and the dignity and poise of the quee woman who inspired it.

That the statue is a portrait the writer little doubt. Careful measurements of face show that the eyes are not of the sa size, that the ears are not at the same le that the left corner of the mouth is hig than the right, and so on. Such idios crasies are not to be found in idealised imagined faces. But in a subtle way t give character and interest to the living f as every skilled portrait-painter and sculp knows. The statue is carved in Linc oolite stone from the "Silver Bed" la It is 6 ft. 2 in. high—the exact height Edward I himself. It represents the Qu standing with her left foot advanced, carry the train of her cloak over her right a and holding in her much weathered ri hand something that was probably a scar gloves or the tassel of her cloak. Her h dress is ornamented with a trefoil patt which is still visible at the corners. Ex that the hands are too small, as was tomary in the statues of the period, figure is in correct proportion.



Although intended to be viewed from be the clumsy device of making the head shoulders unduly large, adopted by Gi and the Florentine sculptors in similar ca has not been used. The necessary effect been obtained by a natural inclination ward of the head. The statue is not e metrical about any centre line. Yet it its symmetrical niche with perfect harm It is beautiful when viewed from all positi and in almost all lights. In certain asp the face has a serenity that reminds on the great Egyptian statues. This is m due to the extremely sensitive modellin the mouth and chin. Like Donatello, and

ike many of the ancient Egyptian sculptors, ..e creator of the Queen Margaret Statue ealised that the greatest results could be ..tained by concentrating on the mouth and ...n, rather than upon any other features. As a piece of carving it is a "miracle in ..ne." The draperies are "alive" with ..tle folds and creases. In some parts ..ose that hang over the right hand and arm, ..re not more than half an inch thick! The ..wer draperies are undercut upwards for more ..an six inches!

At first sight the design would appear to .. too delicate for a stone figure which was .. be exposed for centuries to wind and rain .. the exterior of a building. Closer exami-..ation, however, shows the consummate ..raftsmanship of the sculptor. The head and ..ce are protected from the rain by the for-..ard bend. The thin portions of the drapery ..re vertical and drain quickly; a few short ..engths of these are the only parts of the ..tatue that have been restored. We, there-..ore, find that after six hundred years of ..xposure it is only the hands and the lower ..arts of the draperies, where the water has ..lung and the frost has penetrated, which ..re appreciably damaged.

Produced at the very zenith of achievement ..f Gothic craftsmanship, the Queen Margaret ..tatue is possibly the finest and most per-..ect example of mediæval portrait sculpture ..eft in Europe. The name of the sculptor ..as not yet been ascertained, though search ..s being made for it by examining the records ..f payments made in the early part of ..dward II's reign, and in similar ways. ..he sculptor might well prove to be ..lexander of Abingdon, who was responsible ..or the Eleanor figures on the Waltham ..ross.

Two other statues, which are obviously by ..he same hand, still exist at Lincoln. These ..re the well-known figures of Edward and ..leanor, which are to be found in the next ..iche to the Queen Margaret Statue. The ..gure of Eleanor has been largely restored.

Profile of Head.
(With background blocked out.)

and is, in consequence, of little interest. The lower draperies of the Edward figure are, however, still untouched except by time. It is probable that all three statues were planned during the respite from the Scottish wars (1305-1307), and that Queen Margaret herself supervised their making.

The builder of the Russell Chapel, who, less than two hundred years after the Queen Margaret Statue was hauled into place, hacked part of it away, must not be judged too harshly. There were plenty of mediæval statues in his time! Moreover, individu statues, however fine, were not greatly tre sured by men who felt that they could st create even better statues at their will. F us the case is far different. The conditio under which the great mediæval statues we created have disappeared, never to return while at the same time considerably less tha one per cent. of the work of the mediæv figure sculptors still survives. It woul therefore, seem desirable that the Quee Margaret Statue should be removed from i exposed position, where it is gradually bein disintegrated by the acid and frost-laden air the east winds, and where its exceptional beau has remained unnoticed and unappreciated long, and brought within the shelter of t cathedral.

The writer found Dean Fry quite in syn pathy with this point of view, and he te tatively discussed with him the possibility the removal of the statue to a specially pr pared niche at the back of the altar scree in the Angel Choir. If this suggestion, aft due consideration, is ultimately carried ou the Queen Margaret Statue will be place in a setting which, though in many respec less advantageous than its present one, wi be worthy even of its quite unusual grac and beauty.

The Royal Sanitary Institute.

Acting on the advice of the adjudicators, t Council of the Royal Sanitary Institute h awarded the Henry Saxon Snell prize of fif guineas and the silver medal of the Institute Mr. E. Thomas Swinson, M.R.San.I. (Feltham writing under the motto "Cave Dweller." Tw of the other essays showed considerable meri and the Council has decided to recognise this b making a supplementary award of a Bron Medal of the Institute, to each of the writer Mr. Edward E. Barks, A.R.I.B.A. (London writing under the motto "Agenda Pro Bo Publico," and Mr. F. R. Jelley (Sutton), writi under the motto, "Plebs."

CORRESPONDENCE

[While we are glad to publish letters on professional and other matters of interest to our readers, it must be understood that we do not necessarily endorse the remarks of correspondents, who will oblige us if they will express their views as briefly as possible.]

Craftsmanship and Architects.

SIR,—I can well understand your zeal in furthering so excellent and timely a proposal as this; therefore you naturally devoted to it the opening "Note" for the week in the last issue of *The Builder*, thus giving your warm support to a long-desired movement started with the approval of the Council of the Royal Institute of British Architects on the recommendation of the Art Standing Committee. An additional Committee at Conduit-street is intended to institute immediately a scheme for the co-ordination of craftsmanship in relation to Architecture. This really amounts to a revival of methods often advocated half a century ago by such masters as Wm. Butterfield, Wm. Burges, E. W. Godwin, Eden Nesfield, Norman Shaw, G. F. Bodley, G. E. Street, Thomas G. Jackson, J. L. Pearson, Philip Webb and Mr. Basil Champneys. That this revival should emerge immediately after the recent amalgamation of the Society of Architects with the R.I.B.A. is a remarkable fact which cannot fail to furnish a highly pleasurable surprise to those who live to recall, as I do, the formation of this Society. The "Whirligig of time" inevitably "works wonders." The founders of the Society no doubt set out with the noble intention of promoting "Registration," but in order to gain support in the initial stages not a few were induced to believe that the Arts and Crafts would be also incorporated on practical lines. Thus, at the outset, my friends, J. M. Brydon and J. D. Sedding, with others of their school, began to participate in the hope that such an idea might materialise. They induced me to attend the inaugural meeting of the Society, held in the Council Chamber of the Strand Board of Works, in Tavistock-street. We speedily realised, however, that the majority cared nothing about the applied arts and the pioneers fundamentally differed from our views and objects, consequently J. M. Brydon and his mistaken, or misled, supporters naturally felt that the "subsequent proceedings interested them no more," so accordingly withdrew. I never attended any other meeting. I do not wish to decry "Registration," for which the Society has done so much. Circumstances no doubt have changed; therefore, bowing to the wishes of the vast majority of architects in this country, I voted in support of the unified scheme adopted last July by the splendid gathering held at Caxton Hall, Westminster. I rejoice that amalgamation has been accomplished in the interests of the profession as a whole, but I reckon that by encouraging the Arts allied to building in the way now proposed the Art of Architecture will assuredly make greater headway and, I hope, become worthy of our advantages and enormous opportunities. I have no doubt about the ultimate success of the project if properly handled. The experience of the ages is in evidence, hence my assurance.

MAURICE B. ADAMS (F.R.I.B.A.).

Bedford Park.

British Confederation of Arts.

SIR,—The Organising Council of the British Confederation of Arts has become aware of the existence of an exhibition, namely, the International Exhibition of Decorative Arts, Paris, 1925, and wishes to make it public to the general body of artists. The exhibition is being purely organised to show what the world has done since the war in specifically modern art—not in date but in spirit. The Organising Council of the British Confederation of Arts some time ago asked for wider representation of artists on the Fine Arts Commission, and now demands wider representation upon the Committee handling this Exhibition. The Organising Council is a centre for organised action on the part of all types of Art Societies. The Fine Arts Commission is a body of individuals which, although of high standing, must represent the individual outlook and not the collective outlook. Therefore, the British Confederation of Arts is the right organ to assist the Exhibition Committee and the Fine Arts Commission in determining the national policy to be pursued in arriving at a thoroughly representative British show at this all important exhibition. The Organising Council of the British Confederation of Arts would influence artists to depart from their usual unpatriotic custom on these occasions and encourage them this time to have the patriotism to send the finest and latest work to bring credit to the British section.

A. SEDGWICK, *Honorary Secretary.*

Assessing Competitions.

SIR,—I beg a little space in your columns to protest against the ridiculous time taken by some assessors in settling small competitions. In a recent case, the money to be spent was less than £2,000, and yet more than two months were taken to come to a decision.

The smaller the competition the longer would appear to be the time required to assess it. Sir Edwin Cooper, I think, set a good example to some assessors by settling a big competition within a fortnight. Competitors are placed at a disadvantage as they cannot write to the promoters owing to the risk of being disqualified. I believe a lot of competitors would join me in this protest.

"COMPETITOR."

Northumberland War Memorial.

The memorial to the men of the 6th (Territorial) Battalion Northumberland Fusiliers was recently unveiled at Newcastle by Major-General Sir P. S. Wilkinson, K.C.M.G. The bronze is the work of Mr. J. M. W. Reid, A.R.C.A., Master of Sculpture, King Edward VI School of Art, Armstrong College, and the architects for the work are Messrs. Cackett & Burns Dick, Newcastle.

Old Farm near Lisieux, France. Sketch by MR. A. C. FARE, A.R.I.B.A.

HE EFFECTS ON BUILDNGS OF THE JAPANESE EARTHQUAKE OF 1923

By CHARLES DAVISON, F.G.S.

The effects on buildings of the great Japan- earthquake of September 1, 1923, have n described in two papers recently pubed. Professor A. Imamura has written a uable preliminary report on the earthquake general,* and Mr. H. M. Hadley has died the effects of the shock on different types buildings.† The tables given by Professor amura show how slight was the damage ually caused by the shock itself in the two ef cities. In Yokohama, 12.4 per cent., and Tokyo less than 1 per cent., of the houses lapsed completely. In the towns and vil- es along the low-lying earthy shores of gami Bay the figures were much higher. ching 95.5 per cent. at Arima and Tateno, 7 per cent. at Hodyo and Nago, and 97.8 cent. at Simosoga. Mr. K. Suda has mined the effects of the site on the disbution of the damage.‡ His main result is t the intensity of the shock depends for most part on the nature of the ground. an example, he refers to three villages amada, Kasukabe, and Yamanaka) which built on alluvium. In each of them more n 60 per cent. of the houses were entirely troyed, while houses in the surrounding trict, built on harder ground, were pracally undamaged.

Mr. Hadley's brief paper is of great inest. He has examined hundreds of buildrs that stood uninjured and hundreds of ers that were damaged or had collapsed. Tokyo and Yokohama the buildings were structed of various materials, wooden struces of the light Japanese type predominating. ck was used in buildings up to four stories height, reinforced concrete for others up to hundred feet high, and, more recently, el has been used in the largest buildings limited to the latter height. "Whatever material of construction," says Mr. dley, "the undamaged building was the so framed and braced that it moved bodily a block or unit with its foundations when se foundations were moved by the irresistiforce of the seismic waves. Whatever the terial of construction, increasing damage, to the state of complete collapse, was protional to lack of lateral strength and idity. Whether the lateral strength and idity was secured by trussing, frame ion, or by the use of adequate wall construn, was immaterial."

At the time of the earthquake there were sixn large steel-framed buildings in Tokyo. of them were uninjured, the rest were re or less severely damaged. The former e preserved by their complete or extene use of reinforced concrete wall construn, which stiffened and braced them. In latter, material was used for their wall struction that was deficient in tensile ngth, and afforded little or no stiffening heir steel frame. "Such buildings swayed ently and had their exterior and court walls ttered and broken, interior partitions cked and broken, plastering destroyed, rble trim shaken down and broken, elevas damaged, etc." In houses built of reined concrete lateral strength and rigidity e possessed by those undamaged, and reined concrete at the corners of buildings was icient to protect them from damage. Of k buildings, those which escaped had ry exterior and division walls well tied ether. The behaviour of wooden buildings the same as that of the others; when adetely braced they were uninjured, otherwise collapsed. After two months' investigaMr. Hadley concludes that "earthquake-proof construction could be secured with any material, but that safest and most economical results could be obtained with structural steel or reinforced concrete, both embodying an adequate amount of reinforced wall construction."

ROYAL INSTITUTE OF BRITISH ARCHITECTS

We take the following notes from the Minutes of the Council Meeting held on November 17 :—

Architectural Copyright.—On the recommendation of the Practice Standing Committee, it was decided to inform the Board of Trade, in reply to the Board's request for the observations of the R.I.B.A. as to the desirability or otherwise of introducing legislation for the purpose of setting up a Statutory Register of Copyright, that in the opinion of the Council it is desirable that legislation should be introduced for the purpose of setting up a Statutory Register of Copyright, provided that assurances are obtained that the rights granted under the Copyright Act of 1911 are not affected in any way.

Richmond Bridge.—Reports were received from the Art Standing Committee and the Town-Planning Committee on the subject of the proposed widening of Richmond Bridge, and it was decided to take steps to call the attention of the authorities concerned to the undesirability of widening the Bridge and the necessity of a broad consideration of the whole question of new bridges over the Thames outside the County of London.

British Architects' Conference, 1925.—On the recommendation of the Allied Societies' Conference the offer of the Northern Architectural Association to organise the Conference in their province in 1925 was cordially accepted.

Housing Fees Tribunal.—The Tribunal presented its final report on its work since its appointment in 1922, and in releasing the Tribunal from its duties the Council passed a very cordial vote of thanks to the members of the Tribunal for their indefatigable and successful labours in the interests of the profession.

RECORDS IN STONE

Sir Banister Fletcher, F.R.I.B.A., lectured recently at the Central School of Arts and Crafts on the subject of Romanesque architecture in France, preceding the great cathedral-building or Gothic epoch. He described how Romanesque architecture, indirectly derived from Roman, evolved a series of different constructive expedients in different parts of the country, and eventually produced the Gothic style, first in the north. These ancient churches showed the intertwined histories of English and French kings, when much of France belonged to England, and there were many architectural exchanges. France, said the lecturer, had not the marble of Italy, but good building stone, and had great vivacity and inventiveness. The great dividing line between peoples and styles was the Loire, and vaults and domes in the south against the usurping arches and concentrated thrusts of the north showed how the latter style, from its distance from Roman influence, grew more progressive in spirit, and led up to the building genius of the "Ile de France."

Bethlem Hospital.

The City of London Corporation recently considered the question of the removal of the Royal Hospital of Bethlem from its present site in Lambeth. A new site has been found by the Governors at Monks Orchard Estate, near Eden Park, Croydon. The freehold is to be transferred to the Corporation and will be leased to the Governors at a nominal rental. The freehold of the existing site at Lambeth, at present the property of the Corporation, will be conveyed to the Governors. The new site at Eden Park is to cost approximately £33,000.

Bull Inn Yard, Ludlow.

URBAN AMENITY

In his eighth lecture on Town Planning, at Birmingham University, Mr. William Haywood, F.R.I.B.A., said of the several factors which contributed to amenity in the material condition of towns—other than beauty of situation—a consistent scale and manner were most important and most difficult to secure. Consistency of general effect was sometimes attempted by the imposition of a uniform style of building; sometimes reliance was placed upon one-man control as a means for securing the necessary cohesion. These methods, however, could only result in a consistency of mediocrity, with no prospect of any distinction of manner unless handled with genius; and in that case, too, they must still fail in representative character. In these days, the true source of urban amenity was in the disposition of the populace, and was best moved by the stirring of many minds toward a high standard of general excellence.

Towns which had become large only by the multiplication of small parts would usually be deficient in a scale appropriate to their new size. They had provincial towns in England of an importance, population and wealth, which, for adequate expression, required an almost metropolitan character in their equipment; yet they remained so ill provided with civic and social accommodation proportioned to their condition that their people appeared unsuited to the larger life that the growth of their environment had made possible.

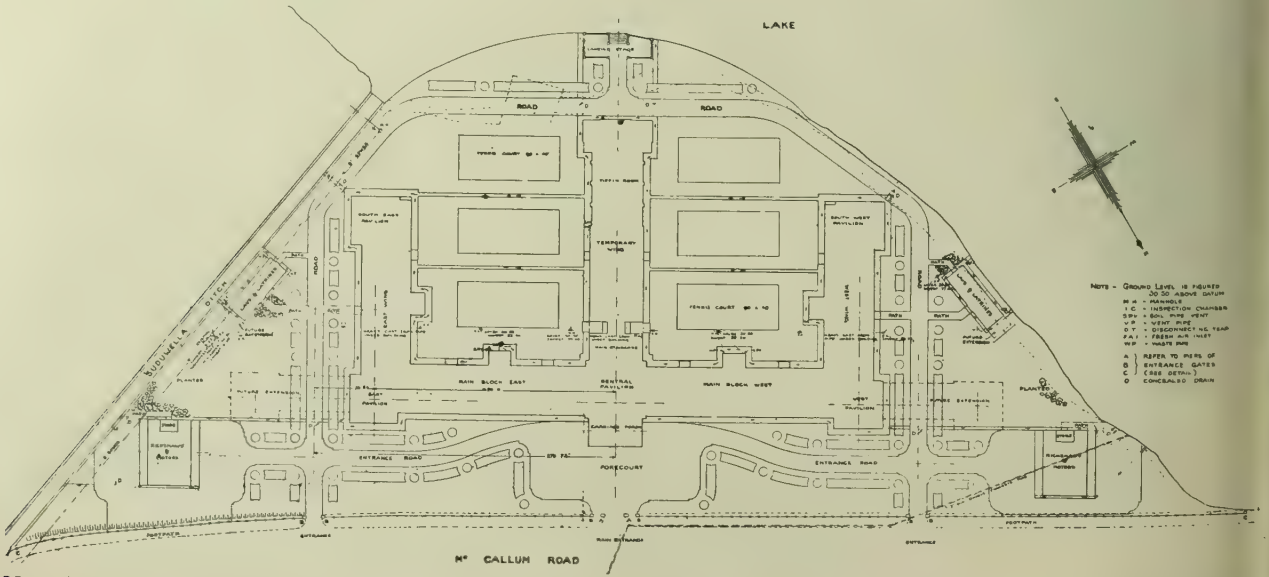
The value of amenity in towns could be most effectively demonstrated by the great building periods of the past, when beauty was thought to be as essential a factor in city life, as convenient and rapid transit facilities were to-day. But while the past might stimulate by example, it could not properly serve as a model. Modern towns which sought to give their growth an appropriate expression, must effect this by an imaginative treatment of their own vital energies. Industry and its equipment had much potential beauty; and the predominate occupation of all towns, whether it be industry or not, should be regarded as an essential factor in the determination of an amenity suitable to local conditions.

LEEDS ARCHITECTURAL SOCIETY

MR. W. ALBAN JONES recently gave his Presidential Address before this Society. In the course of his remarks Mr. Jones said the improved tastes displayed by modern business firms, as compared with thirty years ago, rendered it highly probable that the architecture of the proposed new street improvement from the Leeds Town Hall to Vicar-lane would be much superior to that of the last improvement in Briggate, which cleared away the old Shambles. The vista of this proposed new street with the Town Hall as the dominating focal point at one end, held out an alluring prospect to architects.

With regard to State housing, Mr. Jones said the hectic period under the 1919 Act was now about over. Architects, for the first time in history, were largely employed under this Act, and if the actual part they took in it was more widely known to the public they would at any rate absolve them. Architects were the only body who met Dr. Addison before prices soared so high, and agreed beforehand on a reasonable scale of payment, to which they faithfully kept, except for a few isolated cases, which they deplored, where previous agreements had been made. One had only to reflect for a moment to realise what a totally different result the Act might have had if contractors and trade unions had followed the architects' example and agreed upon a reasonable fixed rate for their services.

Under this fixed scale, the architect's fee, even on the £1,100 house, worked out to about £20 per house, so that if this had been eliminated entirely it would have made little difference to the financial disaster.



The whole of the accounts for the Leeds Corporation houses were not yet available, but they knew that the cost would work out very much below the national average of £1,100 each. He predicted that the local average would be nearer £900 for those built by competitive tenders obtained under Leeds architects. By far the cheapest houses built in Leeds under the Addison Act were those for which competitive tenders were obtained under architects and to their special plans, at £308 per house plus cost of land with roads and sewers.

In reference to the new Act, Mr. Jones said it was in the reaction from the extravagance of the Addison Act that the chief danger lay of an extremely ugly countryside. Last May he attended at Whitehall as President of the Society, forming one of a deputation to urge upon the late Minister of Health the advisability of architects functioning in further housing schemes. Briefly put, he gathered that they were talking to the converted at Whitehall, but as these matters were to be left largely in the hands of local authorities, their best plan was to convince them. He knew of no better service to architecture at the present time than so convincing local authorities.

So great was the hunger of the nation for houses that it had lost all niceties in its appetite, and if cast-iron houses for Robots proved economic proposition, æsthetic objections w of no avail. The only convincing argume must be on the economic side. They must stu to prove that architects could function as sav of the public purse rather than spenders. T less funds for disposal the more need for a skil architecct,

New Railway Offices, Colombo.

This building is to accommodate the central aff of the Ceylon Government Railways, the veral departments of which are now dispersed rough a number of scattered buildings. The te is a level and open promontory jutting into e larger of the two lakes which lie behind lombo Harbour, from which they are accessible locks and are therefore not tidal. On the posite side of McCallum-road, upon which e building fronts, lie the extensive sidings, ores, goods sheds and loco. and carriage ops of the railway.

The new building is conspicuous from distant ews in several directions, and is not a central ublic building. This consideration has led to oad emphasis in the general lines and large ale in the parts of a design which has sought combine the tradition of Western Europe ith indigenous forms.

The entrance block and pavilions and dress-gs are of concrete, ashlar faced in the mould ith granolithic and washed down while still een to bring out the grain and give a surface xture. The main wall face of connecting locks is finished in stucco on brickwork. The onstructional system is armoured concrete. he architect is Mr. H. B. Creswell, working in llaboration with Mr. D. McMillan, Engineer f Ways and Works, Ceylon Government ailways, under whose direction the building being erected.

House on St. George's Hill, Weybridge.

This house, designed by Mr. E. Stanley Hall, .R.I.B.A., is built of mottled stock bricks, ith red quoins to the windows, and the roof of tiles. The windows are steel casements with aded lights, hung in oak frames. The ground oor contains sitting hall, dining and drawing oms, and study. All the sitting rooms id hall have mahogany doors and oak ors. On the first floor there are five drooms and two bath rooms, with a butler's droom off the back stairs. On the second oor are three bedrooms, one bath room, nd a box room. The garage is situated on the orth-east side of the house. There is a rrace at the back and west side of the ouse, and below the south terrace is a long owling lawn The tennis court is on a unk lawn on the west of the house. The hole of the work is being carried out by Messrs. W. G. Tarrant, Ltd., of Byfleet.

New Office Building.

The clerk of the works for this building, at 0–64, Broadway, is Mr. John Warlow, and not s stated in our last issue.

Concrete Church.

We give this week two interior views and a detail of ornament of the Church of the Sacred Heart, Washington, which has been built entirely of concrete. In this building a great deal of experimental work in the surface treatment of concrete was carried out by Mr. John J. Ealey, who, in a recent interview, said: "Architectural sculptors have for years struggled against the suppression of their art by increasing costs of executing designs in permanent materials. Some years ago it became clear to me that the economy which would again permit the freedom of design which existed before industry took the profession of skilled workmen from the arts would rest upon new principles. My attention was attracted to concrete as a medium of artistic expression, and the culmination of my efforts in this direction is the work on the interior of the Church of the Sacred Heart." The whole of the interior decoration is in bare concrete, in colours obtained by using different coloured aggregates and scrubbing the film of cement from the surface after the formwork was removed. The shape of the decorative details was obtained by the design of the formwork Messrs. Murphy & Olmstead are the architects'

Church House, Newtown.

The Church House at Newtown has been built as a war memorial. The building is faced with rustic bricks and grey terra-cotta dressings, having a combed face.

The building contractors are Messrs. Treasure & Son, Ltd., of Shrewsbury; the heating engineers are the Paragon Heating Co., of Birmingham. Mr. G. T. Bassett, A.R.I.B.A., is the architect.

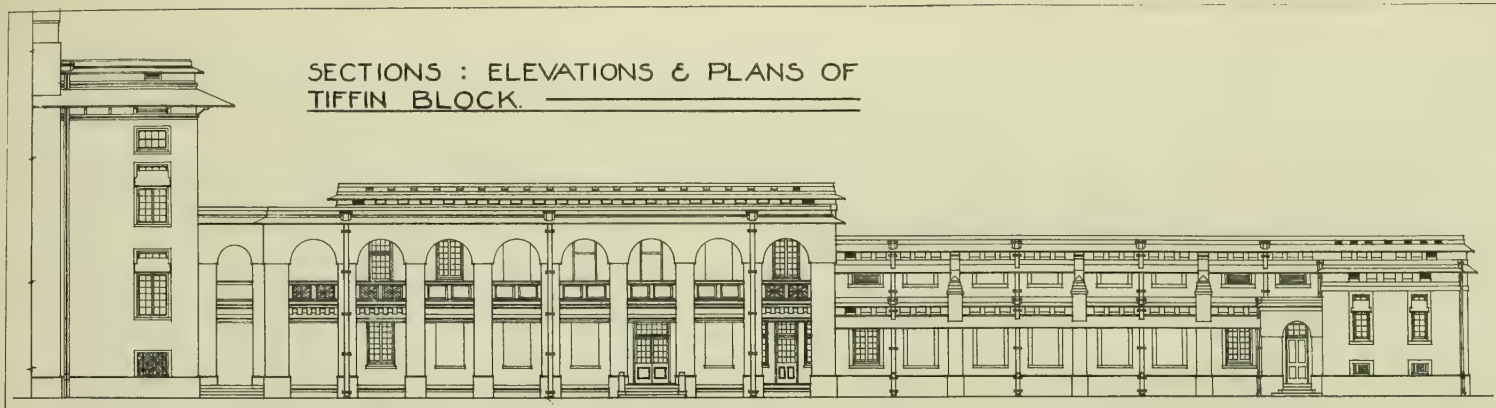
St. Bride's Memorial.

A memorial to Thomas Weelkes, organist of Chichester Cathedral, who died in 1623, was recently unveiled in St. Bride's Church, Fleet-street, and dedicated by the Rev. Lewis Gilbert-son, president of the Madrigal Society. The memorial is in bronze by Mr. P. G. Bentham, A.R.B.S., from a design by Professor A. E. Richardson (Messrs. Richardson & Gill, architects to St. Bride's), and is illustrated on p. 886

Church of the Sacred Heart, Washington: One of the Side Aisles.

MESSRS. MURPHY & ELMSTEAD, Architects.

The Silver Reredos for the Lady Chapel of Saint Mark's Church, Philadelphia.



Designed by MR. WALTER STOYE.

[This silver reredos has been designed to form, with the altar, the central feature of the interior of the Lady Chapel. The decorative detail, although all original work, has been designed to harmonise in character with the altar and the chapel building. The whole work is carried out in solid silver with the exception of the Agnus Dei, which is made of solid gold, and the various jewels, consisting of sapphires, rubies, tourmalines, pearls, amethysts, topaz, chrysoprase, some six hundred in number, are also set in gold. The reredos measures in its main lines 6 ft. 9 in. from side to side and 10 ft. 11⅜ in. from the base to the top of the central pinnacle. The three pinnacles correspond to the mullions of the window immediately behind and are arranged so as not to interfere with the stained glass. The work was carried out by Messrs. Barkentin & Krall, Ltd., of London, who have been engaged on the work for two years.]

STMINSTER ABBEY RE-EXAMINED.—X

By W. R. LETHABY.

MOSAICS AND STAINED GLASS.*—Part I.

gs.—At Westminster, there are six ble examples of Roman mosaic works hirteenth century, a group unequalled Rome itself: (1) The Pavement of bytery, dated 1268; (2) The Pavement Confessor's Chapel; (3) Tomb of the Princes, John and Alphonso, and of e, daughter of Henry III; (4) Tomb John and Margaret de Valence; (5) the Confessor's Shrine, 1279; (6) Tomb r III.

ay begin our examination of the ry floor with the description of Keepe, 'Ascending by two or three Steps n come to the Rails that compass in Altar, you there behold that noble and brious inlaid Floor still remaining t was done by the command of Richard , Abbot of Westminster; where in ificial Work and delightful Figures you *Jasper*, the *Porphyry*, the *Lydian*, the e *Alabaster*, and the Serpentine stones, and wrought to the Spectator's satisiat you are unwillingly drawn from the reof; round the Squares and Great n Letters of Brass, are some of the ill remaining, which when entire were e read, concerning the duration of the *Si lector*," &c.

oor was in fact of red and green porand glass mosaic inlaid in Purbeck On it were Latin inscriptions: (*a*) a rse around the Central circle to the it it was an image of the archetypal (*b*) a curious prophetic calculation as ong the world would last; (*c*) words e work to this effect, + the year of 268, King Henry the Third, the City Odoricus (mosaic-worker), and the Richard Ware) assembled these porones together.

inute details given in the accurate woodcut in "Gleanings," can still for the most part be verified, although some letters and indents of the inscriptions have disappeared in the sixty years since the drawing was made. Around the central disc six letters now remain of the words, MoNsTrAt aRchEtypum. Of

Fig. 2 (one line).

the straight band on the north side there only exists a letter of lapidEs; and O and E remain on the east side. Most of the straight band on the east can be read from the indents beginning + Xri, and the important line containing the names is still certain on the west—*Tercius Henricus Rex, Urbs, Odoricus et Abbas.* The

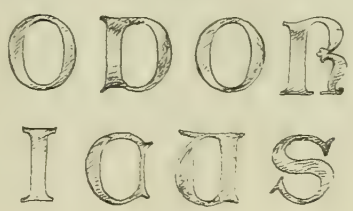

Fig. 3 (one line).

curious prophetic inscription was on the strip round about the four circles next to the big central circle. (See Neale and *Gleanings.*) Here I have found two brass points (:) in a continuous sunk groove. The lettering on Abbot Ware's grave slab seems to have been of the same kind. Both of these have entirely disappeared—the dots on Fig. 1 show the positions of these inscriptions. Fig. 2 is a restoration of what remains of the name of Henry III, and Fig. 3 is the name of the artist; this is usually given as Odericus, but the second vowel was certainly O. Both names are in a single line.

Many parallels to the prophetic inscription are known. In the evening *Westminster Gazette*, October 26, 1906, a correspondent quoted an old Gaelic saying, "*Tri aois coin aios eich*," &c.:—

"Thrice dog's age, age of horse;
Thrice horse's age, age of man;
Thrice man's age, age of deer;
Thrice deer's age, age of eagle;
Thrice eagle's age, age of oak."

A complete record of this wonderful and romantic pavement fully illustrated by a minute survey, should be made at once—there is some necessary loss by age, and probably the last trace of a letter disappears every year.

The plan of the floor given by Ackermann, together with Malcolm's detailed description, when compared with the minutely accurate plan in *Gleanings*—made before the repairs of 1866—make it possible to decide that in 1800 the details of the pavement were much as they are to-day. Ta man is recorded to have made a careful plan in the eighteenth century, but I cannot discover if it now exists. The plan (Fig. 1) is from an outline print of Ackermann's tinted engraving, and on this I have dotted the position of the inscriptions.

The floor as we have it now has been much repaired; often it appears with plain marble in place of intricate mosaic patterns. Burges observed that the big central circle "has a very modern look," also that the fillings of the four smaller circles round about it were not satisfactory. Most of the fillings of the small circles in the wide margin look equally doubtful. Neale speaks of injury "by wear and the removal of thousands of tesseræ." Ackermann (1811) cites the "lamenting enthusiasm" of Malcolm. Malcolm himself (1803), beginning his description of the Presbytery with the then existing Altar, continues: "Descending two steps which cover parts of the mosaic, we tread on the wreck of the most glorious work in England; venerable through age, costly in its materials, and invaluable for its workmanship. What must have been the glories of this holy place soon after the completion of the church! An admirer of the arts must view it with deepest regret. . . . since it has been the custom to show the choir for money, it is trodden, worn and dirtied daily by hundreds. Is it not a national treasure? When it is quite destroyed can we show such another?" He then gives a detailed description, from which it appears

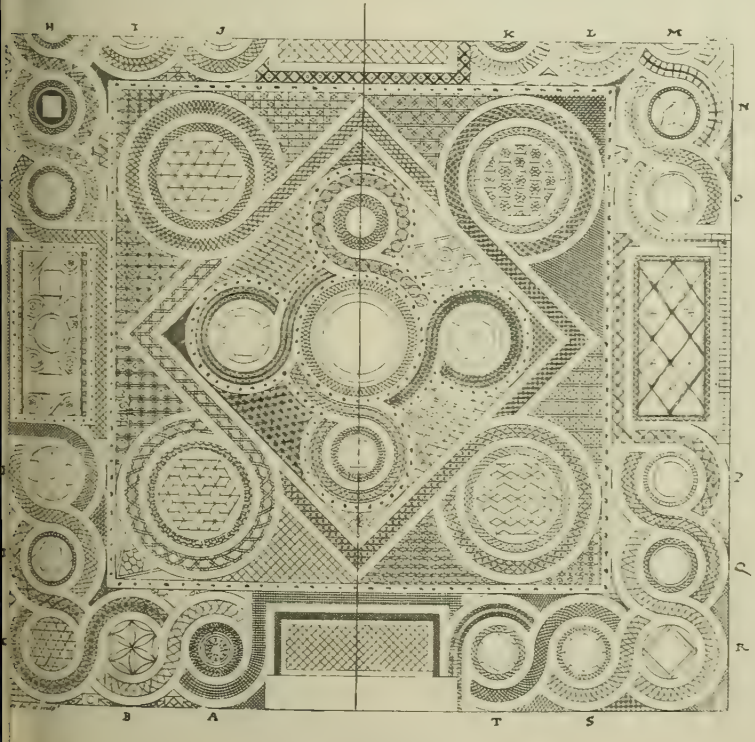

Fig. 1.

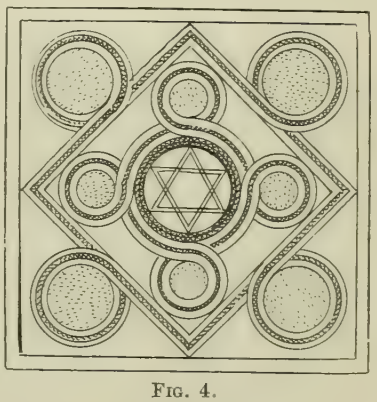

Fig. 4.

that the number of brass letters which remained were much as at present, and that the band of stars around the central circle was "much depredated." It is clear that the floor as we have it now must to a considerable extent be the result of successive repairs.

It is said that the larger circle near the north-west angle was renewed about fifty years since This would be in 1866, when Scott refaced the reredos and "restored" the destroyed half of the eastern margin of the floor. The pattern of the circle and doubtless the other repairs of the time carried on the old design. The plainer strips filling out the spaces on the north and

* last part I would add the following note: describing the Chantry of Henry V, says he was examining it "a large portion of ies fell by their own weight, which has nore solidity than limps of sand dried in They have been covered with whitewash ins perfect till the stone actually powders beneath it."

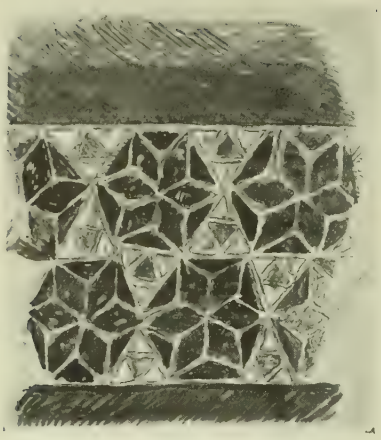

FIG. 5.

south sides were added. An abbot's coffin, thought to be Crokesley's, now in St. Paul's Chapel, was found at this time in front of the reredos, and another coffin—probably Ware's—was seen on the north side. The foundations of the Confessor's church were also then discovered.

I consulted the late Mr. W. Brindley about the large central circle, and he said: "It certainly would have been more worn if it had been there from the first; circles like this for table-tops have long come into the country." The original centre may have been of porphyry or have had some device relating to the surrounding inscription. As was observed by Miss Mary Hervey and myself independently, Holbein's portrait of the Ambassadors in the National Gallery represents this floor and the central circle here contains two interlocking triangles. Fig. 4 gives as a complete plan the indications of the perspective in the picture. The same pattern of interlaced triangles also occurs in the stained glass of the apse windows made in Wren's time. It also occurs in the original mosaic pavement of the Confessor's Chapel. From these facts we might certainly infer that the central circle had these interlacing triangles were it not that it is possible that the Confessor's pavement was the source from which the pattern was taken by both Holbein and Wren. This symbolic device is sometimes called the Shield of David. The short inscription round about would seem to have had reference to some special device or representation here. The late mediæval writer, Sporley, says that the meaning of the short inscription was that the round stone had the colours of the four elements—fire, air, water and earth. This brings to mind a plan of the universe given by Matthew Paris in a British Museum MS., which shows four concentric circles inscribed fire, air, water and earth. Either by the mixed tints of porphyry or by some definite arrangement of colours the universe was symbolised. This central circle is surrounded by a band of glass-mosaic forming a star pattern (Fig. 5). Glass mosaic is also found in the grave slabs on the north and south sides. Burges seems to have thougth that the use of glass tesseræ was confined to these places, but it seems originally to have been distributed all over the floor.

The intricate and altogether remarkable filling of circle E on the plan Fig. 1 is largely of glass. It is now so far obliterated that without the help of sketches and a rubbing made many years ago it is doubtful if it now could be made out. It is certainly entirely original (Fig. 6). Medallion A, Fig. 1, looks modern in workmanship and material, but the design may be old. B almost certainly had the spandrels of mosaic like a similar circle in the Confessor's Chapel, but all is now of marble; C seems largely

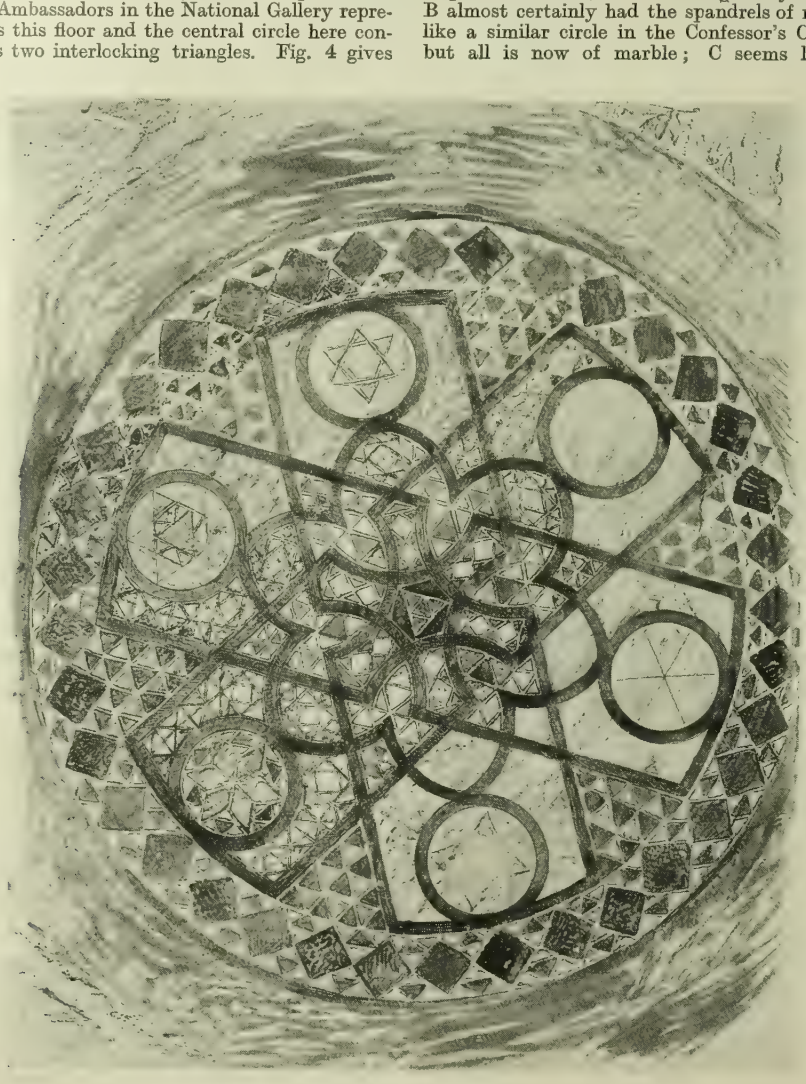

FIG. 6.

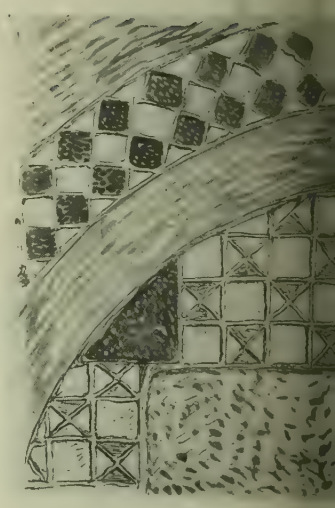

FIG. 7.

ancient; D, of marble, is probably renewal; E is discussed above; F is d semi-modern; G still retains mosaic small square slab, and this may be, or re ancient work (Fig. 7). H to M were cu semi-modern steps; the circles were by Scott in 1866. K, perhaps in part, the old pattern. The rest, N–T, seem t semi-modern.

The history of the floor is fully docu The lettering formerly around the grave north side told how Abbot Richard brought the stones from "the City." Patent Roll for 1269 is this interesting which I have never seen quoted: "A ledgment of £50 to the Abbot for the pa which he brought with him from the C Rome to the King's use to be put in the at Westminster before the King's grea there and for the service which he did t at the Castle of Kenilworth." This re to the Vatican suggests that the materi have been a gift from the Pope. In t Roll for 1267–8 appears an entry for the of certain *cementariorum pavatorum* before the Feretory of Saint Edward. craftsmen must have been Odoricus assistants. In the Roll for 1271–2 o similar entry "for making the pavement the various altars." This may refer Confessor's Altar and an Altar of Relics same chapel.

Confessor's Chapel.—When I studi floor before I thought that the mosai not have been laid until Henry III's to in place, for the pattern stops short tomb, and that it might be as late a On the other hand, provision for this to its execution, or at least commencen probable during the life of the King. T slab of John de Valence (died 1277) s form a considered part of this floor, and now suggest that it was begun on the co of the Presbytery pavement. Burges that this floor was an English work imitation of the Presbytery pavement

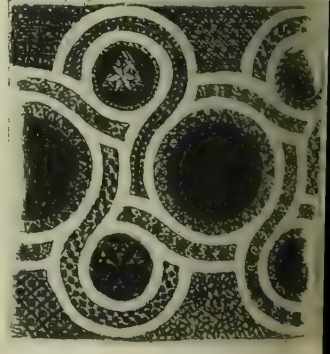

FIG. 8.

in Sta. Prassede in Rome may be put vidence on this point. This example is panel, but the pattern and details are imilar, and it is cut in on a slab in the way as ours. See the illustration in Mr. ristie's delightful book on "Pattern " (Fig. 8). The Roman panel, he tells ms the front of an altar, and it bears an tion with the date 1238. It might be of the masters who later worked at inster.

dea of these mosaic workers was constant on of the minor patterns. Of the dozens les filled with patterns in the floor of nfessor's Chapel, there do not seem to een two alike. Some sketches hurriedly hen the floor was uncovered are here to those I gave before (Figs. 9 and 10).

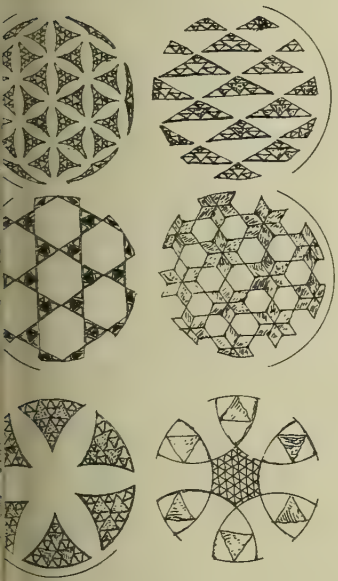

FIG. 10.

is an enlarged detail. Some others with al plan are contained in the first volume Architectural Association Sketch Book. o Scott's *Gleanings*, Malcolm, and some s in the Print Room, South Kensington, e of the floors.)

Confessor's Shrine.—The high marble saic basis which supported the golden r shrine was of minute workmanship. e existing portions still show this was f gilt-glass tesseræ, the glow and glitter must have been the most marked ristic. An inscription in large letters glass on a gold ground recorded that it work of *Petrus Romanus Civis*, 1279.

1910 an American student, Miss Waern, sent me a small photograph of ument of Pope Clement IV at Viterbo e note, "This is said to be by your ster Pietro d'Oderisio. It looks *new* as been moved about and set up again lly decently restored about fifty years again in 1885; but the simple elegance is still very charming after first shock *of scrape.*" (Fig. 12). This tomb of Clement IV (died 1268) was signed by Petrus Oderisi, and in a guide book to Viterbo, published as early as 1894, it had been noted that it must have been made by the artist who worked at Westminster.

FIG. 12.

This identification was adopted by Professor Frothingham in *Monuments of Christian Rome* (1908), and by Mr. Gerald Davies (1910). Frothingham thought that Petrus and Odoricus of the Westminster inscriptions were probably one, for "it was sometimes the habit to call a man by his patronymic." Mr. Gerald Davies writes: "The father wrought the pavement of the Presbytery, while the son Pietro Oderisi completed and signed the tomb of the Confessor. . . . Another son of Oderisi, Stephane, is known." The best reading of the facts would, I think, be that Odoric and his sons were the most famous mosaic workers in Rome in the period 1260–70, that Henry III, advised by the Pope, through Abbot Ware, attracted the father to Westminster. The Pope died in 1268 while Odoric was away from Rome, and Peter, his son, made the Papal tomb. When this was done Peter came to Westminster to execute the basement of the Confessor's shrine. He may have been here before with Odoric. Frothingham wrote of him thus: "A leader of the Roman School, Peter, son of Oderisius, made the first attempt to introduce both sculpture and mosaic decoration in sepulchral art in his tomb of Clement IV at Viterbo in 1268. . . . He also *for the first time* substituted for the antique architrave and classical orders the Gothic trefoil arch and foliated capitals; it was quite a revolution." Our shrine base has trefoil arches, and we may ask: was the revolution in the Roman marble-workers' style a consequence of their contact with Westminster? A comparison between the works at Westminster and Viterbo shows such resemblances as confirms the view that they are both by the same master. The main arch of the Viterbo tomb has cusps in the Westminster style. One of the arched compartments at Westminster is filled in a singular way by circles at top and bottom connected by vertical strips, and the same awkward arch-filling is found at Viterbo; there one of the columns is inlaid with an inverted chevron pattern, and the same occurs on one of the niche heads of the shrine base. Again, on the tomb of Henry III, which was certainly by the same master who made the shrine base, there are similar patterns and large crosses in the two recesses; there are similar crosses on the Pope's tomb.

The shrine basis was surmounted by a flat cornice band which bore the inscription giving the name of Peter. A fragment of this cornice exists which must have been part of the west end; this is wrought on three sides, and a rebated joint shows that it projected as a "break" about 9 in. beyond the angle.

On comparing the record of the whole of the inscription with a part which is now apparent on the east front, it will be found that extra space was required at the west end for several letters more than those at the east end. This extra space was provided by the projections just described. These projections of the cornice of the west front of the basis were probably supported by the larger spiral mosaic columns, which are now half buried.

Scott says that these pillars at the west end were found to agree in height with those at the east; that is, they would rise to the bed of the inscribed cornice. The best preserved portion of mosaic is in one of these columns and the part formerly buried may have been placed uppermost by Scott. In the Print Room at S. Kensington is a careful drawing, inscribed, "Done in 1850 by uncovering the base of the columns of the tomb of the Confessor. I made this drawing and we then covered it up again.—A MacCallum."

Among the fragments in the Triforium, I recognised some years ago two of small spiral marble columns with lines of gilding following the twist. The shrine at St. Albans had detached spiral columns around the shrine, which are almost exactly like these, and fragments of similar pillars exist at Winchester. (For these, see *Antiquaries' Journal*, October, 1924.) In all these cases, these pillars probably supported candlesticks. There is a Westminster record that in 1290, 46s. 8d. was paid for making three marble columns around the shrine, and our fragments are probably of these. (Fig. 13, without base).

FIG. 11.

The original cornice of the basis was the inscribed course consisting of a "face" with a few mouldings above. When the existing wooden shrine was set on the marble basement by Abbot Feckenham (1556-8), the sides of the marble work were heightened by the addition of

Fig. 13.

a new projecting cornice. At the same time what now appears as a narrow frieze under this new moulded cornice was made longer and wider. It had been the margin of the slab on which the shrine proper rested, and it was originally narrower and shorter than the inscribed band or cornice, forming a "step" above it. This step course was enlarged in an irregular way, as may be seen by the spacing of the pattern, and a few years ago Mr. Westlake found that, on the south side, there was hidden a complete angle piece and return, near, but not at the west end.

The Presbytery pavement, the shrine basis, and the tomb of the Pope at Viterbo, were all signed prominently by the artists who made them. Examination of similar works in Italy shows that this school of Roman mosaic workers made a practice of putting their names on monuments, frequently adding (as in the case of our shrine) the words, "*Civis Romanus.*" This points to the existence of some guild of workers who prided themselves on seeking the inspiration of ancient Rome and turning away from the art of the Tedeschi of the Lombard schools. Such a thought was the germ of the whole Renaissance, which in essence was the rebirth of national culture and the repudiation of Germanism. The Westminster inscriptions are thus specially interesting and they resemble other inscriptions in Italy so closely that it is probable that they were suggested by the craftsmen themselves.

If all the artists who signed themselves Oderisio were of one family they must have been an artistic clan comparable to the Cosmati. The fine bronze doors of Troja Cathedral in South Italy, made in 1119-27, bear the name of Oderisus of Benevento. At Eboli, near Naples, a fine picture of the Crucifixion is signed Robertus de Oderisio, a follower of Giotto (Woltmann and Woermann, "History of Painting"). Dante tells of Oderisi of Gubbio, "the honour of that art which, in Paris, is called illuminating." According to Vasari he was working in Rome bout 1295.

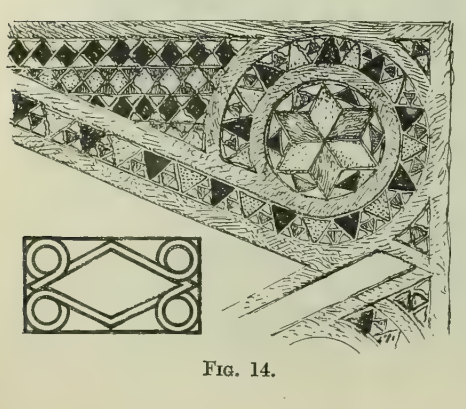

Fig. 14.

The shrine basis is in many ways a work of extraordinary interest. The recent cleaning of it has revealed many details of the mosaic patterns. By the evidence of small portions remaining here and there together with imprints left in the matrix where the mosaic has been picked out, the designs could almost fully be made out and a restored drawing made by any student. Fig. 14 is a restoration of one of the frieze panels. A patient study of this one monument, and more still of the series of mosaic works, would be instructive to do and valuable in result. The point has been reached when special work on details is required.

Tombs.—Recent cleaning has also revealed the glittering splendour of Henry III's tomb. It was a surprise to find that much pure white was used to set off the gold and colour. In the borders, where one pattern is continuous, the background colour is varied in lengths of a few inches. At the east end, where it is sheltered, the panels are largely complete.

The small tomb of the royal children, Katherine, John, Alphonso, &c., now in the south ambulatory, has also been cleaned and the general disposition of the mosaic work can be traced. At the east end the now mostly-hidden panel was like the restored sketch, Fig. 15; the central disc remains and the two on the left may also exist. The side of the tomb which was placed against the wall here, about 1395, may still be in good condition.

Two grave slabs close in front of Henry V's tomb form a part, as has been mentioned, of the

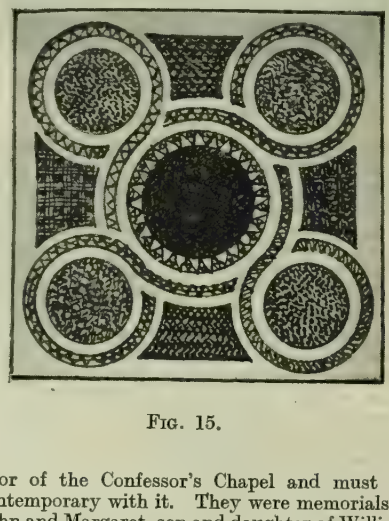

Fig. 15.

floor of the Confessor's Chapel and must be contemporary with it. They were memorials of John and Margaret, son and daughter of William de Valence. Both had brass crosses and one of them had the field set with mosaic; this was probably the tomb of John; it occupied a position on the central axis of the pavement and thus seems to have been the first to be put in place. With the mosaic a few letters were found, . . . LAME : on one side, with traces from which the name Willame could be safely inferred, and on the other side RLEA. About twelve years ago a portion of the plain paving by Henry V's tomb, which overlies the slabs, having been lifted, the end of the second slab was exposed and this retained several letters and imprints giving VALENCE : KI : PUR : LA . . . The name Valence began under the foot of the cross and the rest continued up the south side of the cross.

Putting the remnants of the two inscriptions together it is evident that they must have been in French, and of the well-known form : + Here lies John son of William de Valence for whose soul God have mercy.

The systematic cleaning of the structure and monuments which has been referred to several times has given me more pleasure during my little term than almost anything else—the one exception is the work I have not done in the ancient church.

EXHIBITION NOTI

THE BURLINGTON GALLER

One can enjoy the variety and inter present exhibition at the Burlingt Gallery without having to consider an theories or indulge in futile comparis might ask why this or that particular o been brought here, and the answer wou be found in the intrinsic interest of th It is a richly furnished gallery, for the on the walls and the furniture and obje which are admirably displayed combin a sort of summarised epitome of the which can enfold and overlay all things which surround us. What a w specimen of perfect craftsmanship is especially when you open it up a minutely all the wonders of its make a remarkably fine Gothic cabinet is broad, simple, and vigorous, but with a refinement of effect! What a delight Gothic figure is No. 57! What a fi overmantel is No. 55, and what perfe work is to be found in the old barom and 77! The pictures, the silver w pottery, glass, and the needlework of a stimulating interest, and we feel exhibition such as this, which illustra application of art to many varied obje some senses, the most instructive of a Such things as No. 175, the walnut a (1690), are not often met with, and of a same period are two fine types of stools, 172. One notes the skill and refinemen framework of No. 171. The walnu No. 44 is another of the wonderful speci craftsmanship. Such an exhibition as the sort for one to browse over, as a c very aptly put it.

FINE ART SOCIETY.

The able paintings by Mr. Dacres Ad the Fine Art Society deal largely with a tural subjects, which in many cases a adequately treated, such as the paintin Waterloo Bridge staircase and the loggi There is no mystery or playfulness i serious drawings, but the rendering solidity and mass of the heavier type of b is very satisfying. Finnish Architecture.

Professor Tancred Borenius lectured before the Anglo-Finnish Society, un presidency of the Finnish Minister, at t Edition Club, Little Russell-street. course of his remarks the lecturer said architecture in the Middle Ages was cl ised by its great simplicity and streng churches were built mainly of large blocks, the decorative parts being carri brick. The lecturer gave as typical of Finnish architecture the cathedrals of Borga, and the church at Hattula, wh exceptionally, built entirely of brick. paintings of the churches were oft extensive, and gave an impression of t which English mediæval churches m produced originally.

T. HELEN'S, BISHOPS-GATE *

the nine volumes of the great " Survey ondon," issued jointly by the London ty Council and the London Survey Com-ee, the last one published, that dealing the Parish Church and Priory of St. n, Bishopsgate, is surely the best and informative.

e are told in the preface that this volume he first one dealing with the City of ion, with the exception of the monograph he now removed Crosby Hall, once so but recently re-erected at Chelsea, and but fitting that St. Helen's should have chosen for a commencement because of ne monuments and architecture and of ing easily the first of the ancient churches n its border. Here was also a rich Bene-he nunnery, where for three hundred the daughters of the merchant princes ndon took the veil.

e Church of St. Helen was probably led before the Conquest, though of this, re told, there is no proof, but nothing is known about it until the middle of the th century, when it is mentioned as one he churches in the jurisdiction of St. s Cathedral.

important addition to the church was about 1350, when Adam Francis, mercer, ondon, built a chapel in honour of the Ghost. In August, 1374, he left direc-in his will for the establishment of a tual chantry of St. Mary, and of er in the chapel of his foundation.

bably the greatest personage connected the church was Sir John Crosby, Alder-Sheriff and M.P. for London, and yor of the Staple of Calais," who died 75, and is buried in the church. He be-hed to the high altar of the church 1s. 4d. for offerings " delayed or for-n," 400 marks to endow a chantry for years, 100 marks for keeping his anni-ry, and other sums for various purposes. ad a mansion hard by, and his name is emorated in Crosby Hall and in Crosby-e. To Sir John must be assigned the rches on the south of the parish chancel of which spans his tomb), the mouldings ther details being the same as those ave arcade, and of the ancient painted now in the church; the only parts can be said to have been there before Dissolution are the roundels commemora-of him in the north-east window of the chapel. In this church are also buried Thomas Gresham, the founder of the l Exchange; Francis Bancroft, whose al monument now rests beneath the floor e church in accordance with the instruc-of the deceased that it should remain for undred years and then be placed under d; Sir Andrew Judd; Sir William Picker-Sir John Spencer, an ancestor of the nt Marquis of Northampton; Sir Martin ey, 1634, Lord Mayor of London; and other City worthies whose tombs are of nate character of a bygone age, some of are illustrated in this volume. The records of St. Helen's do not, as in the of several City parishes, include any of eformation date.

e Vestry Minutes begin in 1558, but there erious gap between 1578 and 1676. The hwardens' Accounts begin in 1563. These ls contain a certain amount of informa-relative to the fabric, the material por-of which are printed in a former vicar's the Rev. J. E. Cox's " Annals of St. 's, Bishopsgate," published in 1876.

e nuns' church, together with the rest of riory buildings, was granted in 1542 to ichard Williams (*alias* Cromwell). The ersellers' Company acquired their property in St. Helen's in 1543, and with it the nuns' choir. In 1561 the Vestry Minutes refer to a conference with this company as to " the repairing and amendment of certaine decayed places on the outside of the north Ile of the Church," and sometime between these two dates the parish had come into possession of the fabric of the nuns' church, but whether by gift or purchase does not appear.

The religious troubles of the middle of the seventeenth century are reflected in two entries in the Churchwardens' Accounts of 1643-44, relating to the taking down of the cross on the belfry, and the defacing of " superstitious " inscriptions. A sundial was set up on the church in the latter year. Few alterations seem to have been made to the fabric or its fittings during the second half of the seventeenth century. There is, however, mention of a new organ in 1683, and to the pulling down of the old engine-house in 1694. At a Vestry meeting held on October 8, 1696, it was agreed that Sir Christopher Wren should be consulted about the repairs of the church. Something was done and finished in 1697, but no particulars of the work are given. In 1696 an agreement was entered into between the parish and Thomas Armstrong that, in consideration of the sum of £100 and taking down the bells, wheels and ropes in the belfry (over St. Helen's Gate in Bishopsgate), and delivering them safe and sound in the church, Armstrong should have the lease of the belfry for sixty-one years (for the purpose of letting). From this it would appear that the bells hung, and probably had hung since the sixteenth century, over the gate-house at the entry to Great St. Helen's, and that only a clock bell hung in the clock-tower, or steeple, over the church.

On June 18 following it was decided to sell three of the four bells for the repair of the church, a thing frequently and unfortunately often done in those days, and even later.

More than half of the volume is taken up with full-page illustrations, no fewer than 123 of these being placed at the end of the book, after the index and imprint of the printer. Several of these illustrations are from original drawings once forming part of the celebrated Gardner Collection of London prints, recently dispersed by auction, and it is a matter for congratulation that since the major part of the volume was printed those drawings relating to St. Helen's have been secured by the Merchant Taylors' and Leathersellers' Companies, who have lent them for reproduction.

In addition, there are several measured drawings by the late J. L. Pearson, R.A. (traced and rearranged by P. K. Kipps), and Messrs. E. R. B. Harris, F. S. Eden, Robert Pearsall, T. O. Thirtle, E. L. Wratten, G. Gordon Godfrey, Percy W. Lovell, Max Judge, Ellis Marsland, A. E. Bullock, J. W. Bloe, P. S. Hudson, F. S. Morden Green, T. Frank Green, and Ernest A. Mann. There are also numerous photographs and heraldic illustrations, some in the text. The frontispiece is a well-executed coloured representation of stained glass, with the Merchant's Mark of Sir John Crosby in the border, and a Shield of the Arms of Lady Crosby, drawn by F. S. Eden.

We look forward to the forthcoming publication on the parish itself, so full of topographical interest. If these beautifully produced volumes could be issued bound in cloth, instead of stiff wrappers, it would be an advantage.

* The Parish Church of St. Helen's, Bishopsgate. Survey of London, Vol. IX. compiled by Miss M. and A. W. Clapham. (London. B. T. Batsford. Price Two Guineas.

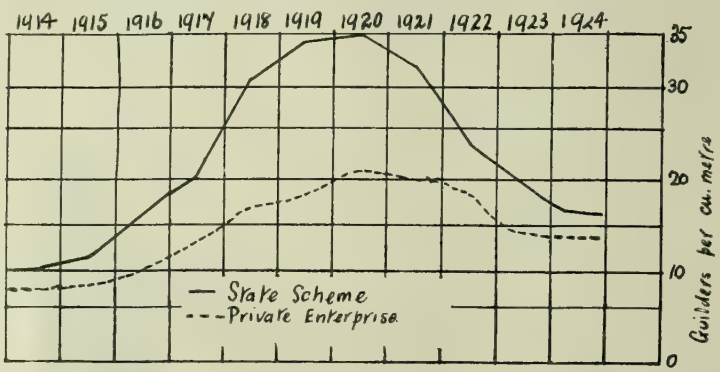
The Death Watch Beetle.

Mr. Leslie Moore, the architect, recently suggested the use of a vacuum machine for the purpose of ridding Peterborough Cathedral of the death watch beetle. It is fitted with a special apparatus which extracts the beetle from positions otherwise inaccessible. This beetle has already caused the cathedral restoration committee an expenditure of £10,000.

LEWIS WAR MEMORIAL, STORNOWAY

This memorial takes the form of a Scottish baronial tower rising to the height of over 85 ft. The lower portion, 18 ft. square and strongly buttressed at each of the angles, reaches to a height of 21 ft., at which height the face width is reduced by intake courses, above which the walls rise uninterruptedly with a slight tapering to the parapets which overhang on triple coursed corbels. On three of the angles the parapet is further corbelled out into circular bastions, and on the remaining angle a circular turret containing a spiral stair gives access to the open platform within the parapets. This turret, with spiral stair, is continued up from the platform level a further height of 10 ft., and with an increased diameter, also terminates with a corbelled and embrasured parapet forming a flag turret, from the platform of which rises a strong steel mast, to which the lightning conductor is connected.

Lewis War Memorial, Stornaway.
Mr. J. Hinton Gall, Lic.R.I.B.A., Architect



Internally, the tower is divided into an arched entrance chamber, 20 ft. high, and four upper chambers reached by square and circular steel stairs, until the granite turnpike stair is reached in the turret. In these chambers bronze panels containing the names of the fallen, numbering upwards of 1,200, belonging to the four parishes of Lewis, will be fixed—a separate chamber being allotted to each parish.

The entrance to the tower on the south face is by a richly moulded arched doorway containing a massive door of Scottish oak, above which are two moulded panels; on one is cut the dedication inscription in English, and on the other in Gaelic. All the dressed work is of fine axed Aberdeenshire granite, and the walls are of native rock (*gneiss*), while the floors are of reinforced concrete. The scheme cost—exclusive of bronze panels—over £4,300. The architect is Mr. John Hinton Gall, Lic.R.I.B.A., of Inverness.

HOUSING IN HOLLAND

At a recent international conference of hygienists in Holland, Mr. H. van der Kaa (Chief State Inspector of Housing) delivered an address on the progress of housing in the Netherlands from the beginning of the present century.

Soon after the outbreak of the war, he said, the prices of building materials began to increase, and building costs increased to such an extent that gradually the building of houses came to a standstill and the Government had to intervene and give assistance. This assistance was not given to private builders, who, until then, had always had a large share in the building of houses, but exclusively to public utility societies and local authorities for State-aided housing schemes. In 1916 the Government agreed to advance to public utility societies a yearly grant towards the building of working-class houses to an amount of half the difference between the annual loan charge and the annual loan charge that would have to be paid if the price of building materials had not increased since August, 1914; provided that the local authority should pay the other half of the difference. By this support the dwellings could be let for the same rent as if they had been built before the war. In 1917 the share of the Government was increased from one-half to 75 per cent. of the whole grant till December 31, 1921.

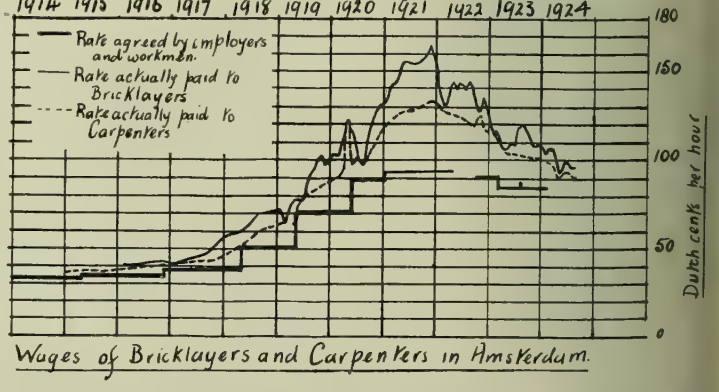
Cost of Erection of Complete Houses in Amsterdam

Housing regulations of the Government took no measures to prevent the cost of building from increasing, and the cost of building of a house in 1920 amounted to three times the cost in 1914; the yearly deficit on each house paid by the Exchequer amounted to 200 guilders, and in some cases it rose to 300 guilders. In 1919, therefore, the regulations were altered, and loans under the Housing Act were advanced at a rate of 5 per cent.; grants on behalf of material prices and rate of interest were done away with and replaced by a yearly grant towards any deficit. The yearly deficit was paid as to 75 per cent. by the Government and 25 per cent. by the local authority.

Rents of existing houses were fixed by the Rent Restriction Act on a low level, with the result that rents remained low and the deficit was paid by the Exchequer, so that this regulation did not prevent the building costs from increasing. In 1920 a minimum rent was fixed for every type of dwelling; for houses not above a cubic space of 225 m. the rent had to cover at least 30 per cent. of the yearly expenses; for houses of a cubic space of 225 to 275 m., at least 60 per cent.; for houses of a cubic space of 275 to 300 m., at least 70 per cent. It was, however, generally known that in case of a rise in building trade wages the Government would be willing to increase the advanced loans and grants, so this regulation had no influence on the rising building cost. Prices of materials began to fall in the course of 1920, but wages increased. The wages paid surpassed those stipulated by contract, and were much higher than the wages of skilled labourers in other trades.

The fall of building costs did not set in until 1921, partly owing to the limitation of the State aid for housing schemes. In 1922 the Government increased the rents of houses built at a time when house-building was not so expensive, in order to decrease the high grants which were required from the Exchequer. Moreover, for the advancing of a loan a stipulation was made that the cost of building should not exceed an amount separately fixed for each municipality, while the Government refused to take into consideration requests for raising loans or grants advanced under these stipulations. In this way building costs were forced down.

The continuation in the rise of building costs during 1917 and 1918 gradually prevented private builders from building houses for the middle classes, and the Government drew up regulations for subsidising the building of houses for the middle classes. For this purpose, in 1918, a subsidy was granted to local authorities, provided that the local authority granted to the party concerned a subsidy to an extent of four-thirds of the subsidy which the Government granted to the local authority. By a regulation in 1919 it was stipulated that a percentage ranging, as a rule, from 150 to 180 per cent. of the pre-war cost of building, had to be covered by the rent. The difference was granted as a lump-sum grant, and paid by the Government and the local authority in the proportion of 3 to 1. In these regulations, too, no measures were taken to prevent the cost of building from increasing, as the whole difference between the actual cost and a fixed amount was paid by the Exchequer. Consequently, the cost of building experienced an excessive rise in some cases. Only in Rotterdam had private builders built on any large scale; for the rest, only local authorities and public utility societies had built houses under this scheme.



Since the increase of building costs set in, private enterprise was not able to carry on, as the subsidies granted to local authorities and public utility societies made it impossible for private builders to erect houses without subsidy. The supply of houses by private enterprise stopped, first for the working classes, then for the middle classes. The supply of dwellings remained entrusted to the public utility so and the local authorities, but it became and more obvious that they were not a solve the housing emergency in a sufficien Experience had taught that private build a rule built quickly and cheaply, and th years confirmed that in many cases authorities and public societies lacked qualities. It became more and more o that, without the help of private ente it would never be possible to succeed i quering the housing emergency. In therefore, a subsidy system was inaug by which grants and loans were advanced the Exchequer. The grant was fixed guilders per square metre area of a dw up to a maximum of 2,000 guilders for dwelling; the contents of a dwelling ava for subsidy could not exceed a cubic sp 450 metres, measured outside above the g floor level. If necessary a mortgage was gra not exceeding 90 per cent. of the buildin without the grant, but including the va the site.

The private builders' subsidy scheme founded on the principle that the State gr a fixed sum to everyone who was going to a house at his own cost and risk, the depending on the dimensions of the h The grant was considered as compensatio the depreciation to be expected in the f The private builder who obtained a gran obliged to keep the houses available for ha tion for at least 15 years, but for the re was allowed to sell or let. The grant entirely paid by the Exchequer. The hand for private builders proved to be an effi means to make the private builders' su scheme popular, and in a relatively short a great revival of private enterprise was ex enced.

The number of dwellings for which the pr builders' subsidy had been made in 1921, and 1923 was 25,281, 29,946 and 33,366 pectively.

Altogether, since the Housing Act came force 225,193 houses had been built by authorities, public utility societies, and pr persons.

On January 1, 1924, more than 2 dwellings were under construction. On A 1924, more than 12,000 dwellings were u construction without financial support complete revival of private enterprise, how is obstructed by difficulties as regards c

Wages of Bricklayers and Carpenters in Amsterdam.

For this reason a number of local auth had established a municipal mortgage which granted credits and mortgages for ing on municipal leasehold grounds. A difficulty as regarded credit was caused b restrictions which depreciated the value dwellings, so that as a rule this value was than the actual building cost. In ord meet these difficulties the Government resolved to supply second mortgages, whi builders must try to get their first mortg another way. The second mortgage amount to 20 per cent. of the buildin and to the maximum of 600 guilders. amount of first and second mortgage to are not to surpass 85 per cent. of the esti cost of a completed house.

CHITECTS' & BUILDERS' INQUIRY BUREAU

glad to give questions and answers, but cannot ponsibility for contributed replies, especially on ers.

e appeal to our correspondents to submit their paper of a size easily filed, and written as possible, or better still, in typescript.—ED.

Made Ground.

Y TO MR. SOUTH, NOVEMBER 14.]

I think Mr. South is hardly in order in hat the weight of the superstructure in accordance with the carrying power oil. As a rule an architect is given a a certain size of structure to place and it is part of his problem to so hat superstructure that its weight is ver so much of the soil as its strength ess demands, or alternatively to increase ng capacity of the soil by piling. It is to build soundly the same plan of on a rock or a marsh. The difference hat in the one case the rock will be and the walls started direct therefrom, the other the weight of the building pread over a large area by means of a the ground consolidated by means or ing.

calculate the weights of the various your building, then determine the apacity of your ground, and treat your ns accordingly.

"PRACTICE."

"Hot Plates."

The question of adequate heating ents for plates and dishes on a gas is reached a crisis, and is a source of ouble to many housewives who cook I should be more than obliged if er could help solve this difficulty. I inted with many of the modern gas but excellent as they are in many this lack of plate accommodation is parent. The usual space allowed is or anyone who values their dinner If a rack is fixed above the cooker, I can see, very little heat reaches it. ny method of improving on this and so oking by gas a pleasure?

"BAFFLED."

Old Beams.

TO "INQUIRER," NOVEMBER 21.]

here are to be found some very useful the restoration of old work in the pamphlet upon the Restoration of Monuments, issued from the office of , price 9d. "ASSOCIATE."

Damp Walls.

O "HOUSEHOLDER," NOVEMBER 21.]

Your correspondent should consult a chitect, in order that the real cause of e may be correctly diagnosed and steps remedy it. It is almost impossible to n opinion from the data given, and it most simple matter, such as an eaves ked and splashing over, or an overflow ping, or merely a case for re-pointing of the wall. Whatever it is, the cause moved and the wall allowed to dry out sting further money or re-plastering orating. "M.A."

Brick Footings.

TO "PROVINCIAL," NOVEMBER 14.]

h reply to "Provincial." The District has no power in his own discretion to the omission of brick footings.

9 of First Schedule to L.B.A., 1894, s: "Unless with the consent of the ery wall other than a wall carried on mer shall have footings. . . ." Your lient's course would be to make application to the L.C.C. for its consent to the omission of the footings.

The writer recently endeavoured to obtain consent, amongst other things, to the omission of brick footings to simple one-story garages, without success. It has been repeatedly shown that footings may be safely dispensed with in many cases, and it is to be hoped that sufficient pressure will be brought to bear in the near future which will result in amendments to meet the economic and practical needs of the present day, and also to avoid glaring inconsistencies in methods adopted by authoritative bodies. Compare the law relating to footings under the L.B.A. with clause 37 of the standard specification for State-aided housing (*The Builder*, September 12, 1919):—

"Footings.—No brick footings are to be provided to any walls."

"LONDON."

Hollow Walls.

SIR,—The correspondence you are publishing with regard to defective hollow walls is timely, for I notice that a very large proportion of small houses are now being erected whose outer walls consist of two half-brick skins, bound together by "galvanised" iron ties. It is, of course, exceedingly difficult to get workmen to build such a wall well, for it is a matter which calls for much more care and thoroughness than the average workman is ever likely to give to it. In addition, there are the very considerable practical difficulties which occur at every point where there are windows, doors, &c.

But that is not all. The almost universally used galvanised iron tie is a perishable product. Everyone who has had experience of exposed galvanised iron knows that the ordinary commercial product can be given a life of ten years or less. I have known galvanised wire to lose its coating and rust in seven years. What is to prevent the galvanised tie from sharing the same fate, especially as mortar is almost invariably dropped on it to hold and convey water.

These things being so, I invite your readers to say what experience they have had of such hollow walls after a term of years. The subject is of great importance, for tens of millions of public money are being sunk in such walls. My own opinion is that, as usually built, they are unsound, but that careful building and the use of earthenware ties might completely change their character and make them desirable.

"L. C. M."

Church Buildings.

SIR,—I wonder if any reader could inform me of the current cost per cubic ft. of church buildings?

I have in mind the smaller type of brick-built church seating from 300 to 400.

"F. C. B."

Brushes.

[REPLY TO "NEMO," NOVEMBER 28.]

SIR,—No. You have clinched the bargain, which is supposed to include tear and wear of brushes and plant.

JOHN M. FIFE.

SIR,—Brushes would come under the head of plant, depreciation of which should be accounted for in the establishment charges, the percentage allowed for which should be largely assessed by previous figures of experience in the business. It is assumed that the agreed percentage of 15 per cent. was to cover builders' profit and establishment charges. I am afraid your correspondent will have to make up his mind to grin and bear the loss (surely a very slight one) into which his oversight has involved him.

"ARCHITECT."

Building By-laws.

SIR,—I shall be much obliged if any of your readers could kindly inform me whether a sectional wooden building standing upon the ground but not in any way attached thereto is generally regarded as being a "building" to which local by-laws relating to construction, &c., would apply. The building referred to is used as a garage, and is the property of the owner of the land. It could be dismantled and re-erected complete on other land if need arose. Would the position be in any way affected if the said building were standing upon wheels (of small diameter)?

Gloucester. "A. G. L."

A Damp Party Wall.

[REPLY TO "BUILDER," NOVEMBER 28.]

SIR,—"Builder" does not state where the property is situated. If in London, it would be controlled by Statute Law (The London Building Act, 1894) regarding party walls; but if outside London the local authority may have by-laws in force made under Section 157 of the Public Health Act, 1875, which would affect his case. The Common Law appertains everywhere unless superseded by Statute Law. There is no question that the wall dividing B and C is a party wall, being a wall of which two adjoining owners are tenants in common. Although, as is stated, the wall is on B's ground, it is nevertheless a party wall, and B is subject to an easement or right to maintain it in its nature of a dividing wall between the two tenements. There is also no doubt that the defective rainwater pipe is for the common use of both B and C, and although it also is on B's property, C has an easement over it by implied grant or reservation; and cannot be restrained from letting surface water from his house pass to and down it. Now it is stated that owing to the rainwater pipe being out of repair and becoming stopped, and the water from the roofs of B and C not being able to get away, injury to the party wall has been caused. On C's side papering, &c., is required to arrest the continuance of the damage.

The principle of contributions by adjoining owners to the expense of erecting a party wall depends at Common Law upon contract express or implied. In this case there is an implied obligation on the part of B to keep the rainwater pipe clear, and to keep the wall in repair on his side of it. Further, the damage on C's side of the wall being directly due to B's negligence, C can recover from present owner of B the loss incurred by papering, &c. B cannot so deal with his tenement as to render the easement over it incapable of being enjoyed by C, and although, in general, B is not bound to repair to ensure such enjoyment by C, here there are special circumstances which impose on B a duty to repair. The present owner of B could, of course, in turn recover from the previous owner of B, unless the former had had notice of the defects, &c., when purchasing. Portions of the party fence are stated to be set back on C's land; this does not cause C to forfeit his ownership of the piece of land so cut off; and since he also owns the fence (by whomsoever it may have been erected), he can, if he wishes, set back the fence to the true dividing line between the two tenements, if that, as it appears, can be distinguished.

"PARTY WALL."

SIR,—In my opinion, if conditions as shown on plans of "Builder" have existed for 20 years, "B" has an easement of roof drainage over "C's" roof, and "C" has an easement for discharge of roof drainage of "B" and "C" over "B's" land—unless the R.W.P. enters "C" premises before reaching the ground. The projecting portion of wall against which the R.W.P. is fixed is "C's" external wall, as are the back addition walls (presumably built in place of fence). "B" should allow the water to take its course to drain, as "C" cannot trespass; also by allowing the "pipe" to be impeded he is preventing the enjoyment of his own easement. "C" is responsible for con-

dition of the R.W.P. and for the pointing and papering. The light iron fence, if in existence in position shown for above-mentioned period, has given "B" the enjoyment of the extra strip and "B" is entitled to that enjoyment.

If these conditions have not existed for the above period "B" is trespassing on "C's" land at the rear. But the roof drainage must stand as the construction of "A," "B," and "C" as one block with roof drainage as existing cannot now be altered without the consent of all parties, and the sale or purchase no doubt provides for *status quo*.

G. G. WIMBOURNE.

Girders.

[REPLY TO MR. R. C. ARNOLD, NOVEMBER 28.]

SIR,—The perforation of the web of a girder at the point of maximum bending moment does actually reduce its resistance to bending, though to a very slight degree. A small area of the web is included in the section modulus of a section, though in rough and ready calculation, with no tables to which reference can be made, it is usual to neglect the web for this purpose. Actually that portion of a ½ in. web on, say, a 20 ft. span lost by such a 3 in. perforation would reduce the bearing capacity by about ⅛th of a ton. A similar perforation at the point of maximum shear would, however, reduce the bearing capacity of the girder by about 9 tons, so that the choice of position for the perforation is obviously the centre, or near it, of the beam. There is actually a position just off the centre of the beam on each side where the maximum efficiency might be secured both as to bending or shear, but the loss of efficiency against bending is so slight as to be almost negligible.

"TABLES."

SIR,—The correct cutting of the 3 in. hole in the joist depends upon the span. For example, assuming a 14 in. by 6 in. by 46 lb. section, the safe distributed load at 24 ft. span amounts to 13.1 tons, resulting in a shear stress of 6.55 tons. Calculating out the net web area after deducting for the 3 in. hole, we have 3.7 sq. in. to resist this shear. The allowable shear stress to resist web buckling amounts to 4.3 tons to the sq. in. times 3-7 area giving a safe carrying capacity of 15.9 tons, approximately 2.5 times actual load to be carried. The minimum span for cutting at the supports is 10 ft. If the joist is below this span and heavily loaded, inquirer's suggestion holds good; above 10 ft. span cutting away at the centre means a reduction in carrying capacity, admittedly small, being near the neutral axis of the section.

F. C. D.

Decay in Stone.

SIR,—I should be very grateful if you could inform me where I can obtain reliable information and help as to the best means of preserving stone against decay. I should prefer this to come from private sources rather than from a commercial firm interested in the subject.

"CONSTANT READER."

Thickness of Lead.

SIR,—Can you inform me of the respective thicknesses of sheet lead of 4 lbs., 5 lbs., and 6 lbs. weight, and also of the best method of measuring the same. It is a matter upon which a supervising architect can be very easily deceived if his experience is limited like my own.

"YOUNG ARCHITECT."

Wall Paper.

SIR,—I have been under the impression that wall papers are of a standard size of 12 yds. long to the piece by 21 in., and had ordered material accordingly, only to find myself sadly short on the job. I then discovered that the pieces were only 8 yds. long and 18 in. wide. Surely this is an unusual size?

"AMATEUR."

BUILDING CONTRACTS

CAPTAIN W. T. CRESWELL, Barrister-at-Law, recently gave a special lecture at the College of Estate Management on "Building Contracts."

A building contract or agreement was, he said, a legally binding instrument which had for its subject matter the conditions governing the erection of a building, and by which one person undertook, for a consideration, to erect for another person the said works in conformity with the said conditions. The terms "Contract" and "Agreement" had the same legal significance; but, in practice, "Building Contract" had come to be used where the work to be done was for the use and benefit of the landowner; whereas, when the intention was that a lease, or other interest in the land, was to be immediately granted to the contractor on completion of the building, then the instrument was called a "Building Agreement." The term "Contractor" was popularly applied only to persons in a large way of business, but legally, any person entering on a contract or agreement to carry out work, for a consideration, was a contractor.

The usual course was that the employer or prospective building owner invited lump sum tenders, providing plans, drawings and specification (and sometimes bills of quantities) giving full details of the work proposed, so that contractors might prepare satisfactory estimates for tendering. The most difficult task in preparing these estimates was to compute the "on costs" item. That was the sum required to be laid out before the actual work of construction began. The cost of labour, materials, and the contractor's profits were more easily ascertainable. In the case of a measurement contract the "on costs" must be proportionately distributed amongst the schedule items. There was ample opportunity for anyone who had the ability to do these things.

Tenders were legally "invitations to treat," or offers to receive offers, and did not bind the person inviting them. Therefore, though it was customary to state that the employer did not bind himself to accept the lowest or any tender, this precaution was not essential to his freedom to reject all. When the offer or tender had been sent to the employer, and he had accepted, and not until then, the contract became binding on both parties; the contractor might, however, recall his tender up to the moment when acceptance could be proved to have been sent or given to him. In order that a contract might be legally binding, the offer thereby defined and accepted must refer to a fixed consideration; though that consideration need not necessarily be of money, but might be wholly or partly of "kind." The exception to this rule, however, occurred when the contract was under the seal of a corporation, in which circumstances the remuneration or consideration need not be definitely named. If a date were named in the invitation, at which the offers would be accepted or rejected, the decision must be made promptly, or the tenders could be revoked. If no time was fixed, then only reasonable delay could be claimed, or the employer might for a further consideration contract for the holding over of all or any of the tenders received during the further period. Proof of posting a strayed or delayed letter of acceptance was final evidence; also, acceptance could be alleged if either party had shown by his conduct that he intended to accept. The same restrictions applied to revocation of a tender.

In a ruling case, Croshaw *v.* Pritchard, the contractor had sent in a letter headed "Estimate." Finding later that an error had been made, he sought to revoke his offer, as being only an estimate. The employer refused to comply, and was able, in an action in court, to recover from this contractor the sum in excess of this "estimate" which he, the employer, had paid to another contractor to complete the work. But release from a contract had been given by the courts error was of such magnitude tha obvious to a reasonably minded pe was always open to the contractor in his tender any additional conditio should govern his carrying out of If he tendered without reservation bound by the terms of the contrac the other hand, the employer did his unwillingness to accept the co conditions of service, these condition part of the contract.

A tender must be definite—for in it were advertised that the lowest ten be accepted, and a person offered to "at £200 less than the lowest name that was not a bona-fide tender; and tractor, having named the lowest actu could claim the job.

The documents at first laid before tractor were not necessarily a formal This document was often drawn u but all that was necessary, to esta existence of a contract, was to prove parties had "a contracting mind" tain date. Misrepresentation by the or his authorised agent released the c from his bond; whilst acceptance b authorised agent did not bind the emp an architect accepted a tender on be client, he should always state that contract was to be signed later, and it was done. The stamping of within prescribed periods was leg manded, and a heavy penalty was im non-stamping.

It was perfectly legal for several to confer amongst themselves and to conditions whereby one of their numbe tender, and the others abstain on that they should provide part of the materials asked for, or abstain altoge long only as their arrangements v against public policy, or in restraint they were legally binding.

An interesting point was made in tinction of "liquidated damages "penalties"—two terms often interchanged in building contracts. dated damages" were fines which and evidently were, ascertained by tracting parties before signing the "Penalties" were fines of uncert and did not assess the loss, but were as security for the due performanc contract. Whichever term had been the phraseology of the contract, t would, if necessary, correct it in c with these definitions. The point b "liquidated damages" were re in the exact amount named, "penalties" might be recover on the assessment of the court in r the actual damage or loss sustained penalty clause for delay in comple building contract, the fines should "liquidated damages," and in that c not be interfered with by the court.

Town Planning.

The Ministry of Health state tha of the general importance of town not only to local authorities and the but also to private interests concern development of land, the part of th Report of the Ministry of Health for which deals with this subject has lished separately.

The report contains a stater only of the position of town schemes throughout the country at t the year and of the progress of regi ning, but also of the attitude of the on a number of points of general i which have arisen in connection v planning and with appeals relating t developments.

Copies of the publication may be price 6d., direct from H.M.S.O.

THE BUILDING TRADE

UICK-HARDENING ORTLAND CEMENT

ew of the great saving in time and, , of money which could be effected ent were available which would harden idly than the Portland cement we know great deal of attention has been given roduction of a quick-hardening cement ould not be prohibitive in price for building and constructional purposes. derable amount of research in this has been undertaken recently by manufacturers in this country, as a which the Cement Marketing Co., Ltd., nd House, Tothill-street, S.W.1, are on the market a new quick-hardening cement of the "Ferrocrete" brand.

s of tests on this new cement is now dertaken at the City and Guilds En- College at South Kensington, under tion of Professor Dixon. A number of nd cubes were cast on Monday last best ordinary Portland cement and the ck-hardening Portland cement, the ne being to test two of each type at 2 days, 4 days, 7 days, 28 days, and nths approximately. The beams are g by 10½ in. deep by 6 in. thick for ose of the test, supported on knife 6 in. from each end and the load t a point 2 ft. 6 in. each way from the The beams were designed by Dr. ber, O.B.E., D.Sc., and are reinforced n. rods.

'days' and 4 days' tests were made on ay and Friday last week, and the ests on Monday last.

erage results of the beam tests so far ut are approximately as follows:—

	Age 54 hours. lbs.	Age 100 hours. lbs.	Age 7 days. lbs.
Cement	4,000	7,000	9,260
rdening			
ete ..	14,000	19,000	21,000

sults of the tests on 6 in. cubes so far oximately as follows:—

	Age 56 hours. lbs. per sq. in.	Age 100 hours. lbs. per sq. in.	Age 7 days. lbs. per sq. in.
Cement	700	1,200	1,050
rdening			
ete ..	2,450	4,000	5,100

ams and cubes were all made of a ix by the same workmen and of the regates, the only difference being in nt.

thus be seen that the new quick- cement under practical conditions greater strength at 48 hours than is by the British Standard Specification s, and as this is a true Portland cement th will undoubtedly be maintained and with age. It is an entirely British pro- the price, we understand, will be not n 25 per cent. more than best quality ortland cements. It is of interest to this new quick-hardening cement is d by the Westminster City Council in , where the work of reconstructing part d foundation commenced on Monday; ps in road works that the greatest use nd for the material, and the inconveni- ed by roads being "up" for lengthy lleviated, for with such a cement it possible to lay the wood blocks or face the day after the concrete has ed. In building construction, too, a ith such rapid-hardening properties rmit of more speedy erection in many , and is likely to give an impetus to concrete construction, which has een somewhat handicapped on account e required to allow shuttering to be

APPRENTICES IN THE BUILDING INDUSTRY

THE following scheme for the training of apprentices in the building industry was submitted by Councillor Mitchell (Manchester City Council) to a Conference of Lancashire and Cheshire local authorities, and has now the unanimous approval of conferences organised by the National Housing and Town-Planning Council, representing Yorkshire, Lancashire and Cheshire, Midlands, North-East Coast, and the West of England.

The objects of the scheme are to co-ordinate by means of a committee the functions of the local education authority as to the technical training of youths entering the building industry with those of the Manchester, Salford and District Building Trades Apprenticeship Joint Committee, and to secure (*a*) the efficient training of apprentices in both the theory and practice of the craft, and (*b*) the continuance of such training through all the stages of apprenticeship.

The scheme would be controlled by a committee consisting of twenty-four representatives, selected as follows: (*a*) Four to be appointed by the Education Committee of the Manchester City Council; (*b*) sixteen by the Manchester, Salford and District Building Trades Apprenticeship Joint Council; (*c*) four by the Housing Committee of the Manchester City Council.

The committee would from time to time consult with the Manchester, Salford and District Building Trades Apprenticeship Joint Council as to the number of apprentices required to be trained in the several branches of the industry, and of the steps to be taken to secure the necessary number of apprentices. They would also keep a panel of employers willing to train apprentices, and advise as to the conditions of apprenticeship and agreements between employers and indentured apprentices. The number of apprentices to be trained under the scheme in any one year would be estimated annually by the committee, who would have power to make arrangements for securing the objects of this scheme as they might deem necessary.

The scheme would be available to youths resident within the City of Manchester between the "school leaving age" and 20 years. Youths under the age of 16 would be required to serve a probationary period of not less than six months before articles of apprenticeship were completed. Applicants before being admitted as probationers would satisfy the Committee of their fitness for the craft selected, and afterwards the Education Committee of their ability to benefit by the technical education to be provided. Youths desiring to enter the industry after attaining the age of 16 would satisfy the committee of their ability to become efficient journeymen within a period not exceeding four years from the date of their apprenticeship.

Training would be available as follows: (*a*) Technical training provided by the Manchester Education Committee under the Regulations of the Board of Education; and (*b*) practical training provided by employers.

Youths admitted under the scheme would observe the following conditions, namely: (*a*) Attend on days required at the centre where technical instruction is to be given; and (*b*) become indentured as the committee may approve, abide by the terms of such indentures, and where necessary be willing to be transferred to another employer as the committee might determine.

The apprenticeship period, in the case of youths under the age of 16 years, would begin at the end of the probationary period, and in other cases on such date as the Committee might determine. The rate of pay for probationers and apprentices would be that fixed by the Manchester, Salford and District Building Trades Apprenticeship Joint Council. Where the application of a youth above the age of 16 years were approved, and he was subsequently indentured, the rate of pay might be varied by arrangement between the Committee and the Joint Council.

No apprentice would be required or permitted to work overtime during the first three years of his apprenticeship, or when his attendance at a centre of instruction was required, and in no case until he had attained the age of 17 years, or contrary to the decision of the Joint Committee. Where overtime was worked the apprentice would be paid for the time worked at a rate proportionate to the increase allowed to journeymen in the same craft.

The rate of wages would start at 10 per cent. of the journeyman's rate at the age of 14 years, increasing every six months until 70 per cent. of the journeyman's rate was reached at the age of 21 years.

NATIONAL HOUSE BUILDING COMMITTEE

THE Ministry of Health state that on November 27 the Minister of Health and the Secretary for Scotland received a deputation from the National House Building Committee that was set up by Mr. Wheatley to assist him in carrying out the scheme embodied in the Housing Act of last Session. The deputation consisted of: Messrs. W. H. Nicholls, Barron, Strange, Coppock, and White.

Mr. Nicholls, on behalf of the deputation, said that their object in seeing the Minister was to discover whether they wanted the Committee to continue in being and carry on the work of arranging for the augmentation of skilled craftsmen in the building trade, with which they had already made considerable progress. They felt themselves that it was useless for them to continue in being if the Government contemplated any sudden reversal of housing policy or any slowing down of the provision of houses. On the other hand, they felt that they could make a valuable contribution to the solution of the housing problem if the present Government intended to carry on in its essentials the scheme which had been started by the late Government.

Mr. Chamberlain, replying to the deputation, said that he thought nothing was more likely to hinder an early solution of the housing problem than a series of sudden reversals of policy, and he did not contemplate making any violent changes in the existing legislative provisions. There was no question that the provision of houses must be pressed on as rapidly as possible, and the immediate problem was the augmentation of the supplies of labour and materials. To this end he agreed that the Committee could make a valuable contribution, and while thanking them for the work that they had already done he assured them that he was most anxious for it to continue and would give them every support possible. The question of the progress that had already been made and the contemplated procedure was briefly discussed.

New Stirling Infirmary.

Proposals for a new infirmary for the town and district were made at the annual meeting recently of subscribers to Stirling Royal Infirmary. Mr. James Millar, architect, reported on a plan for extending the present infirmary by taking in the Girls' Industrial School and grounds; the estimated cost of the scheme was from £40,000 to £45,000, and the extension, when completed, might only suffice for the needs of the district for fifteen or twenty years. The question of an entirely new infirmary on a new site was then faced, and the cost ascertained to be from £65,000 to £70,000, exclusive of the cost of the site. After a full consideration of the schemes, the directors recommended the adoption of the larger proposal, being convinced that only in this way could they meet the needs of the district. The meeting unanimously approved of the scheme outlined by the directors.

PUBLIC WORKS AND THEIR CONSTRUCTION IN WINTER

By G. M. FLOOD, B.Sc.Eng., A.M.Inst.M. & C.E.

In view of the fact that public works form more than 25 per cent. of all construction, their proper control is therefore of the greatest importance in any programme to distribute general constructional activity more evenly throughout the year. The essential requirement for a good public policy is that contracts for public works should be let when the work can be performed economically and with the least possible interference with private construction. On analysis, it will be found that public improvements are rushed right along in the peaks of the annual building season, and further, that many public works are initiated without regard to the private demands upon the building and constructional industries.

The execution of public works is well adapted for long-range planning, for expansion in years of depression, and for slowing up in years of general business activity. It is equally possible and most desirable that public works should be planned with special regard to seasonal conditions, and that all work which is not urgently required be either held up until the peak season is passed, or started early enough to take advantage of the general mid-winter slump. With the intelligent use of new methods of construction and of protection of both men and buildings during the winter season, much of this work is well suited for economical prosecution during the winter season. That work which is not suitable to carry on actively during winter weather can still be planned so as to proceed at maximum capacity during the intermediate months rather than during peak periods in private work.

With reference to seasonal conditions, one obstacle that has been found to prevent such conscious scheduling is the limitation imposed either by statute or customary procedure in preparation for public works construction. Thus, where work is dependent upon legislation through Parliamentary agents and is dependent upon a Royal Assent, or by the simpler procedure, *i.e.*, a provisional order of the Board of Trade, it may not be invested with the authority of an Act of Parliament until late in May or June, and the work, if carried forward promptly, is likely to come within the peak of private building activity.

In many other instances the number of necessary legal steps which must be taken before the work can commence, and the length of time either required by law or made necessary by the procedure itself, so delay the work that it is considered necessary to rush it on to completion as rapidly as possible after the awarding of the contract. In cases of this sort, if the procedure could be simplified, or if each step were not dependent upon a preceding step, this delay would be eliminated and time enough remain so that construction could be scheduled from a seasonal standpoint and, though sometimes stretched out over a longer period, still permit completion at a date as early as under present practice. A very definite step to improve such situations is the provision, either general or specific, that funds be made available to administrative officials for the preparation of plans and specifications well in advance of the time actual construction is to begin, in order to reduce the delay after the appropriation is made.

The public administrative officials in charge of construction works can play an important part in making such changes as are indicated by the needs of economy and employment. Foresight in planning the work, the collection and use of information showing exactly what the seasonal trend is in construction of that particular kind, and the efforts made to change customary or legal requirements which operate to accentuate the seasonal tendency in their construction work, are having a considerable influence in the right direction. If the administrative officials in charge of public works construction were possessed of discretionary powers governing both the letting of the contract and the time limit within which work must be completed, they could effectively be made responsible for the practice of economies and the pursuit of a policy of relieving unemployment through the best timing of the work. Contractors on public works, as well as those on private work, can greatly assist by making a thorough study of the most successful methods employed in winter construction as well as of the problems of management and organisation involved.

Where there are opportunities to take advantages of lower prices of materials, and where greater efficiency is secured from labour during times when employment is less plentiful, the contractor has it in his power to encourage public work in off seasons by passing on these benefits in the form of lower bids. Since his overhead cost per job or unit of work is considerably lessened when his organisation is kept together throughout the year and his machinery and equipment are idle for a shorter period, he can, by taking on winter work, cut his customary margin of profit and still make more money as a result of the full year's work. Contractors, by their general attitude, their willingness to take work during the winter and perform it satisfactorily, and probable lower bids and other inducements, can exert a considerable influence upon the officials with whom contract letting rests, to the end that work shall be timed when it can be carried out most economically.

Amended, revised and new legislative measures will play an important part in bringing about a change in the present methods of handling public construction jobs, and it is only reasonable to assume that with stable government the Public Health Act and the various amending Acts will be revised, amended and consolidated with the Housing and Town-Planning Acts into a simple legislative measure, as near perfect as a combination of legal, engineering and architectural minds can bring it, *i.e.*, a "National Health Consolidation Act."

Where continuing appropriations for a particular kind of work are required in order that such work may be intelligently scheduled to come as largely as practicable in slack seasons, they should be provided. In some cases the granting of greater discretionary powers to the administrative officials in charge of work is needed, and where the legal requirements surrounding the methods of contract letting are unnecessarily complicated or obsolete active steps should be taken to change them. In cases of cities where construction funds are not available until the beginning of a fiscal year, or where construction work is dependent upon the Ministry of Health granting the necessary powers to obtain a loan, at a time which makes contract letting coincide with the peak in private letting, provision should be made for contracts to be let and work to start before the beginning of the fiscal year when the money is to become available.

Where changes are advocated by administrative officials in order to allow them to schedule their work more effectively, attention should be given to the seasonal conditions in question, and every possible allowance made, so that the construction year may be lengthened. In this problem of the seasonal aspects of public construction works the attitude of the general public is of the utmost importance. It is the general public which pays the bills for expensive construction during peak periods, and which suffers because of unemployment in slack times. An active interest in the whole subject, and realisation of the large losses and waste involved in a seven to ten months' building year, should result in bringing sufficient weight of opinion to bear, so that all concerned will be accept the new viewpoint.

The leadership of civic bodies w community, and of newspapers and ot agencies, would help in moulding tallising public sentiment, and would only in lower costs of construction efficient work, but in lessened unem during slack seasons, and in the el of such wasteful competitions for la materials between public and priva as was witnessed during the past three years every time the words ment subsidy" were mooted. Whi buildings and works for the use of and local governments are subject to climatic limitations as private build works, and, in addition, to limitation ing the authorisation and expend money, this field contains probably possibilities for off-season cons Although the amount of building of is small when compared with the to kinds of construction, yet the erect large public building in a small co is likely to have an important influ stabilising construction.

The result of public buildings so would be more economical construction the public and the private builder, overhead costs, actual savings to t payers, and diminished unemployme community during the winter period. a case where the real remedy lies in in the point of view of the public an legislative bodies and officials directly i of this construction work. Contract do this kind of work, ratepay civic organisations, and individuals, help to develop this point of view. T of such work carried on at the m possible speed during the winte slackening up when private dema greatest, would be very important, si are employed who would otherwise b one period of the year and are rele other purposes during the busiest sea

The construction of sewers and wa systems is another important type works in cities. This work is entirel doors and subject to the fullest e weather conditions. The argument severity of the climate is generally as making impossible the successful tion of such work during the winte number of cities with the most climates have a contrary experienc favourable experience of these latt seems to indicate that there are differe of view and different experiences in ing the same work under similar co This appears to show that the habi contractors and the attitude of those of the work need to be changed in carry on winter work of this kind suc That it can be done successfully is the cases mentioned above.

Until methods are changed as a experience, it is not unlikely that ex might not prove wholly successful. W experience to draw upon, with labour itself to new conditions, with the mo sive use of modern machinery for ex back filling and work of that kind. increased understanding of the pub served, it is probable that most of could successfully carry on this work out the year. Even in the cases wher desired actually to carry on outd during a period of two or three month deal can be accomplished adopting a organised programme.

During the winter months the con the pipes, special castings and mach be let, so that delivery is made in in part during the winter months. for pipe laying, building foundations be drawn up during the winter, so materials are received work may as soon as the season will permit. is definitely known that a certain pi struction is to be carried on in ep highly desirable that arrangements and orders given during the winter fo

pipe and other materials that will be

not only has the effect of enabling be started as soon as the season will but it has far-reaching effects in pipe and equipment manufacturers to their work more fully during what is ly an off season. In the case of cast-pe, at least, the winter is the most manufacturing season, and a policy er ordering would have far-reaching This is a case for the attention of mmediately in charge of public works character, and also of those adminis-officials who shape the policies of their ents. Some effort is bound to be re-to change existing habits, but if the ce of some cities is a true guide the us spent will have a widespread bene-fect.

certain, however, that the problems of tration, the training and organisation ur, the necessity for revised and d legislative measures affecting con-n, the proper control of contract letting, public and private works can be ically constructed, must be thoroughly and applied by the Government and overnment departments concerned if t progress is to be made in the ex-acute question of national housing.

Building Labour Augmentation.

recent meeting of the L.C.C. Major moved that it be referred to the Housing tee, the Education Committee, and the Committee on Unemployment to con-id report, in view of the deficiency of labour in the building trades and the ed prevalence of unemployment in other what action the Council can take, in co-n with the building trade employers and es or otherwise, to augment the supply of abour in the building trades available for ding of houses under the Housing Acts.

TEMPORARY BUILDINGS

Mr. Percy C. Culver, of Messrs. William Harbrow, Ltd., recently read a paper at the Northern Polytechnic on this subject. The lecturer first defined a temporary building as one which did not conform to the statutory requirements of the London Building Acts in London, or to the local by-laws elsewhere, so far as these by-laws related to construction. Buildings in this category could be erected under licence granted usually for three to five years, renewable at the discretion of the local authority. Temporary buildings, the lecturer stated, were popularly described as wooden huts or tin buildings and, therefore, it was well to recognise from the commencement that there were several classes of these buildings, ranging from those whose purpose would be filled in a relatively short time to others which were required for periods of fifty to sixty years. This difference in purpose led to substantial differences in construction, and to indicate these variations temporary buildings were classified under the following headings:—(*a*) The entirely timber building; (*b*) the iron building, which was a timber or steel fabric covered externally with galvanised steel sheeting; (*c*) the composite building, either constructed wholly of timber or a combination of steel stanchions and trusses and timber intermediate framing. In each case the framing forming the external walls would be covered with weather boarding, asbestos sheeting, plaster slabs, or lath and plaster, the internal walls and ceilings being finished with plaster slabs, lath and plaster, asbestos sheeting or one of the many types of wall boarding on the market. The roof of such a building would be covered with asbestos slating, ordinary slating, or red earthenware tiling; (*d*) the semi-permanent building, constructed with a skeleton framing of steel stanchions and trusses, and a filling to walls of 4½ in. brickwork or breeze concrete blocks. The roof would be covered with materials similar to those described under the heading of (*c*)—composite building.

In dealing with (*a*)—timber buildings—the lecturer referred to the fact that many examples of old timber buildings existed, constructed of English oak framing, weather boarded sides, and thatched or tiled roofs, and that some of these buildings had been in existence for more than 200 years.

In dealing with the iron building, the lecturer stated that the patenting of galvanised corrugated iron sheeting about 1829 quickly led to its adoption as an external covering. In modern practice the original iron sheet had given place to steel, and he had many experiences—some quite recently—where galvanised iron sheeting had been fixed for some forty years, and after being removed was found to be in extremely good condition. He pointed out the necessity for proper maintenance of the sheeting by regular painting, the length of the intervals being governed by the situation of the structure. Notes were given on standard practice in the proper fixing of this material and attention was drawn to the methods employed to prevent the entry of water over the heads of doors and windows, &c., and the methods employed in forming valleys in the roofs, fixing of skylights and ventilators.

After referring to the great variation between the weight of a brick wall and that of the wall of an iron building, the lecturer proceeded to deal with the question of foundations required for such a structure, and pointed out various methods which could be adopted which, whilst being economical in cost, permitted conformity with the various by-laws, this being specially necessary in cases where 6 in. of concrete over the site was obligatory. For buildings required only for a short period creosoted plates were mentioned as being sufficient. As conducive to economy and speed, the use of light cast iron columns was recommended where concrete over the site was a necessity.

Taking, as a basis, a hall measuring 60 ft. by 30 ft., a description was then given of the various sizes of scantling timber required in the construction of the walls, roof trusses, purlins, &c., mention being made of the various ways in which the timber framework could be prepared. It was emphasised that the standard practice of morticing and tenoning the framework was particularly advantageous in allowing the framework to be erected with the use of relatively few nails, and upon being dismantled the value of the timber would be greater than if the framework had been entirely nailed together. Where the mortice and tenon method was employed for buildings which had to be erected by foreign workmen abroad, a careful system of marking (which conformed to key plans) enabled those erecting the building to proceed without greater difficulty than a child building up a simple picture with blocks. Attention was directed to the advantage of employing three thicknesses of timber in the construction of "built-up" tie beams and principal rafters for large spans, with the main posts formed of two scantlings blocked apart to form a seating for the tie beams; also to the fact that owing to trade conditions the cost of steelwork varied considerably from time to time as compared with the cost of timber, and that it was important (where fire risks or other special conditions did not demand steel trusses) to consider the relative costs, the speed of manufacture, and other points of comparison between the steel and timber trusses for larger spans.

The advantages of the various materials of the composite buildings were explained, particular attention being drawn to the importance of the use of a backing board to all asbestos sheeting when used as an external covering. The economical advantages possessed by the semi-permanent building, as well as the gain to be obtained in the time required for construction were fully dealt with. The present need for economy emphasised the advantages of such buildings and enabled them to fulfil successfully many purposes for which heavier constructions had been hitherto adopted.

NEW BUILDINGS IN LONDON.

Euston-road.—A new public market is being built on a site in Euston-road, N.W.1, on the corner of Mabledon-place, with frontages of 280 ft. and 90 ft. respectively. The construction will be in brick on a steel frame. The roof will be in three spans and will be of asbestos cement tiles with patent glazing on the peaks of the roofs. The floors will be of concrete. Four entrances will be provided, fitted with collapsible gates. Glazed bricks will be used round each entrance, and along the lower part of the exterior walls. The upper part will be cemented. Parallel and transverse gangways will divide up the interior and there will be accommodation for 154 stalls. Water, sewerage, gas, and electric lighting will be laid on. Lavatory accommodation for both sexes will also be provided. The general contractors are Messrs. Kirk & Randall, Ltd., of 146, Grosvenor-road, S.W.1. The steelwork is being supplied and erected by Messrs. The Aston Construction Co., Ltd., Eagle Wharf-road, London, N.1. The electric lighting installation is being carried out by Messrs. Cecil Cooper & Co., Ltd., 14, Gloucester-road, S.W.7. Sanitary fittings, &c., are being supplied by Messrs. Stitson, White & Co., 102, Victoria-street, London, S.W.1. The architect is Mr. S. Gordon Jeeves, 4, George-street, Hanover-square, London, W.1. The quantity surveyor is Mr. W. H. Webber, 33, Furnival-street, London, E.C.4.

Regent-street.—New premises are to be built for the American Shoe Company in Regent-street, W.1. One section of the building is being carried out, and it is expected that work on the remaining portion will be started shortly. The new building will comprise shops and showrooms on the ground and first floors, with basements for storage, and five upper floors, suitable for offices, &c. Elaborate show and shop window fronts will be fitted, executed in bronze and art metal work and bordered in marble. The remainder of the principal elevations will be of Portland stone. The floors will be all carried on a steel framework and will be of fireproof materials. Heating, electric lighting, vacuum and sprinkler systems will be installed, The roof will be covered with slates placed on a concrete covering. The general contractors are Messrs. the Monnoyer British Construction Co., Ltd., of 6, New Burlington-street, London, W.1. The steelwork will be supplied by Messrs. The Astor Construction Co., Ltd., of Eagle Wharf-road, Hoxton, N.1. The architects are Messrs. Henry Tanner, of 3, Hanover-square, London, W.1.

Thornton Heath.—Funds are being raised for the provision of a new Wesleyan Church School at Thornton Heath, Surrey. It is contemplated to raise sufficient money to erect a building to accommodate about 500 children. A brick building, with slated or tiled roof and wooden floors, with central heating, and electric light, is suggested, costing about £5,000. Plans have been prepared by Mr. F. P. Bailey, 17, Norman-road, Thornton Heath.

King William-street.—It is proposed to erect a large office building on the vacant site in Arthur-street and Miles-lane, King William-street, E.C.2, to be known as "Arthur House." The new building will be erected on a steel framework with elevations in Portland stone. There will be five main floors with a further story in a mansard roof, which will be covered with concrete and Cumberland slates. Heating and hot-water supplies, electric lighting equipment, &c., and passenger and goods lifts will be installed. The architects are Messrs. Gunton & Gunton, of Finsbury House, Blomfield-street, E.C.2. The site covers an area of 16,000 square ft., and the estimated cost of the building is £130,000.

Harrow.—The proprietors of the *Harrow Observer* propose to extend their premises in Station-road, Harrow. The new block will be of three stories and will be erected in brick with a certain amount of steelwork to carry the principal loads. The frontage will be about 20 ft. and the area will extend back to 60 ft. from the road. A shop front will be installed on the ground floor. Wood blocks will be used on the ground and top floors, with ordinary wood boarding for the first floor. Electric lighting and central heating will be installed. Extensive top lights will be fitted into the roof. The architect is Mr. S. Poynton Taylor, of Roxeth Hill, Harrow.

Ebury-street.—A new building is to be erected alongside the Goring Hotel, in Ebury-street, Victoria, S.W. 1, as an extension of the hotel. The addition will cover an area of about 1,200 sq. ft., and will have frontages both in Ebury-street and in Victoria-square. A brick structure is to be evolved, so as to be in conformity with the existing hotel, with the introduction of stone dressings for doorways, cills and jambs to windows, strings, cornice, &c. Steel frame work will carry the weight of the building and the floors, which will be of reinforced concrete. Electric lighting and power will be introduced, and heating and hot-water services laid on. A service lift will run between the kitchens and dining room. The architects are Messrs. Giles, Gough & Trollope, of 28, Craven-street, Strand, London, W.C.

Bishopsgate.—New headquarters are to be built in Bishopsgate, E.C.3, for the Hudson's Bay Co. The site has a frontage on each side of St. Helen's-place, and the feature of the new building is the arched entrance-way into St. Helen's-place. The plans show a block of premises extending to seven stories, with basements requiring excavation to a depth of 40 ft. A comprehensive hot-water heating system, operated by oil-fired boilers, will be installed. Two back hoists are also provided for. The elevation to Bishopsgate will be carried out in Portland and Bath stone, richly carved and chased and ornamented with bronze art metal work and castings. The steel work will amount to about 1,000 tons. The windows will mostly be of steel. The roof will be partly asphalted and partly slated, and will also contain two large water tanks. The interior woodwork will be carried out in Italian, Burma, Austrian, and English hardwoods. Ventilation will be provided by an air-washing plant, and wiring for vacuum cleaner installations will be made. The electrical installation will include lighting and power, telephones, burglar and fire alarms, clocks and bells. The floors will be of fireproof, hollow tile ware, reinforced with steel and levelled with concrete. Three large ornamental lamps and a two-dialed clock will be fixed to the street frontage. The architects are Messrs. Mewes & Davis, of 22, Conduit-street, London, W. 1. The consulting engineer is Dr. Oscar Faber, of 5, South-street, Finsbury-pavement, E.C. 2.

Leadenhall-street.—Work has started on the foundations for the new building in Leadenhall-street and Lime-street, E.C. 3, for the Corporation of Lloyds. The site, which covers an area of about one acre, has now been cleared of old buildings, and the first contract—for the foundations—has been given to Messrs. John Mowlem & Co., Ltd., of Ebury Bridge-road, Westminster, S.W. 1. The new building will be of six stories and two basements will be constructed below ground. A steel-frame building is proposed with the street frontages executed in Portland stone. The architect is Sir Edwin Cooper, F.R.I.B.A., of 4, Verulam-buildings, Gray's Inn, London, W.C.

Regent's Canal.—The Gas Light and Coke Co are to construct a large coaling wharf on the Regent's Canal Dock, to be equipped for unloading colliers, &c. Plans have been prepared by Messrs. Rendel, Palmer & Tritton, of 12-14, Dartmouth-street, Westminster, S.W. 1, for a structure, with a deck of reinforced concrete, supported on steel cylinders, filled with concrete, resting on a gravel foundation. The wharf will be nearly 200 ft. long and will be equipped with two electrically-operated coal transporters, fitted with grabs.

Golder's Green.—Among the building work proceeding at Golders Green is a scheme for the erection of two blocks of shops and flats in Finchley-road. Each block will consist of eleven shops, over which will be two stories of flats. The buildings will be in brick with best facing stocks and stone dressings for the str tion. The floors will be of concrete an will be flat and asphalted. A balus run along the top of each block, the of the proposal being about £30,000. tects are Messrs. North, Robin & W 35-39, Maddox-street, London, W. 1.

Exhibition-road.—A large site in E road, South Kensington, S.W. 7, chosen for the erection of the new Museum, which is at present housed in off Piccadilly, W. 1. The new museum a building of three stories and baser will be carried out in Portland stone, tecture conforming to that of the Natural History Museum. The roo flat and asphalted. Large lantern l illuminate the upper floor. The Go have already voted a provisional es £270,000 towards the cost, and plans being prepared by H.M. Office of W Storey's-gate, Westminster, S.W. 1.

Regent-street.—A large block of s offices and showrooms is to be buil site in Regent-street, W. 1, at No A fire-proof building of six floors and with a Portland stone front elevation, to the Crown's Reconstruction Scheme thoroughfare, is proposed. The con will be on the steel frame principle and will be of hollow tile and concrete. The be of Mansard type, of concrete and covered with Westmorland slates. Th of the ground floor will be richly tr fibrous plaster decorations, and will with art metal shop fronts to suit the tenants. The upper floors will be fi plain plaster and distempered. The will all be of the steel or cast-iron type. ate entrance will be provided, to give the upper stories, and a lift will b Electric lighting, central heating, and cleaning plant will be installed. F lights will be provided for the basemen together with the foundations, will b inforced concrete construction, finish asphalte. The architects are Messrs Cook & Darbyshire, of 43, Great Marl street, London, W. 1. The contractor Messrs. Arthur Vigor, Ltd., of 20, Knigh London, S.W.

Hammersmith.—It is proposed to the present licensed premises in Dall Hammersmith, W. 6, owned by Messrs & Co., Ltd., and to erect an entirely modern public house, to be called the of Wales." The cost of the propo premises is £10,000. Brick will be p used for the exterior walls, whilst th roof will be covered with tiles. Accom will be allocated to a private and sa several public bars, and a luncheo The joinery and counter and partition be carried out in mahogany and o woods, whilst the flooring will also be Cellarage will be provided and a da laid. Electric lighting will be used. P been prepared by the owners' archite Kirby.

Cornhill.—A block of office premises built on the site of Nos. 45, 46 & 47 E.C. 3. A building of five stories and with a frontage of about 65 ft. is The elevations will be carried out in stone with a granite base. The floors fireproof construction. The ground have a height of about 17 ft. Centr and electric lighting will be installed. will give access to basement and all fl roof will be asphalted and provided escape staircase. The steel framewo supplied by Messrs. Redpath, Brow Ltd., of 3, Laurence Pounteney-hill E.C. 3. The general contractors a Trollope & Colls, Ltd., of 5, Coler London, E.C. 2. The architects a Campbell Jones, Son & Smithers, of 9. hill, Cannon-street, London, E.C.

Pall-mall.—Messrs. Moreland, Hay Ltd., inform us that they have bee tractors for the steelwork for thi throughout, and not as stated in o last week.

HE INSTITUTION OF HEATING AND VENTILATING ENGINEERS

r. H. W. S. Martin recently read a paper on r Washers and Air Filters," at a meeting he Institution of Heating and Ventilating neers, at the Engineers' Club, London, . The lecturer said that in any of their towns the necessity for washing and ing the air to cleanse and remove the soot smoke before passing it into a public ding was fully recognised. The smoke, of se, should never be allowed to be put into air, but they had not yet generally realised great harm done by this pollution. Very n, possibly, the health authorities would st on the smoke nuisance being stopped, or east very greatly mitigated, but until that e came air washers or filtering apparatus in nection with a plenum heating and ventilat- plant for a public building was essential. most desirable conditions for a public ding required humidity for the air. The rt, dry cough heard repeatedly in a theatre hurch was a clear indication that the air too dry. Taking the lowest winter tem- ture obtained in England, and the Home ce humidity regulations for cotton factories, ch might be regarded as the maximum rable, the degree of humidity to be aimed nd regarded as the standard condition for lth lay between those two extremes. It , however, the medical man who should rmine what was the best and most healthful dard condition, and then the heating and ilating engineer should design his apparatus naintain that condition.

TRADE NEWS

he Casskaid Barrel Skid, manufactured and ributed by Messrs. R. Wickens & Sons, of el, Tonbridge, Kent, is, they state, the most ul all-round appliance for handling 40-gallon s on the market. They claim that it will he work of four men, and that it is simple, g and cheap. With the aid of this skid s can be either conveniently unloaded from cles or emptied from the side.

e have received from Messrs. The Elsan nufacturing Co., 34–5, High Holborn, some resting particulars regarding their indoor tary appliances. They claim—and it is orted by the Institute of Hygiene—that Elsan Closet makes sanitary methods ible for those unable to depend on any public em of drainage. It is portable, well- gned, and can be easily fixed. They state those interested in the promotion of hygiene bound to be interested in this invention. ils are given of a number of installations.

e have received from Messrs. General ors, Ltd., London. a brochure dealing with G.M.C. trucks. This firm are, as is well n, the largest makers of high-class cars and ks in the world, and produce the Buick, illac, Chevrolet, and Oldsmobile cars. claim that in the G.M.C. trucks they have rporated at least seven distinct pioneer ures which give these trucks an unchallenge- superiority over any other truck at present he market. The brochure incidentally gives intending truck purchaser an invaluable dard by which to measure up the qualities y motor truck. General Motors, Ltd.. say kly that in their opinion the more an nding purchaser knows about motor trucks more certainly will such a man be attracted G.M.C. trucks.

(For rates of wages in the Building Trade in Scotland, see page 919.

CONTRACTS, COMPETITIONS, &c.

Forsome contracts still open, but not included in this List, see previous issues. Those with an asterisk are advertised in this number. Certain conditions beyond those given in the following information are imposed in some cases, such as that advertisers do not bind themselves to accept the lowest or any tender; that a fair wages clause shall be observed; that no allowance will be made for tenders; and that deposits are returned on receipt of a bona-fide tender unless stated to the contrary.

The date given at the commencement of each paragraph is the latest date when the tender, or the names of those willing to submit tenders, may be sent in; the name and address at the end is the person from whom or place where quantities, forms of tender, &c., may be obtained.

BUILDING AND PAINTING.

Westminster Women's Housing Council.

At a meeting of the Westminster Women's Housing Council, held at 18, Carlton House-terrace, on Tuesday last week, Miss Picton-Turbervill, President, spoke of the powers which the City Council had under existing legislation to do away with many of the difficulties in regard to bad housing, without a great increase in public expenditure. Sir Arthur Griffiths Boscawen outlined a public utility scheme which the Church Army was in process of forming, for the purpose of housing the ex-soldier and the low wage earner with a family in such a house as he could afford. They had already sufficient funds to start about twelve cottages in Willesden and for the consideration of other building sites, but they were appealing for £300 to enable them to carry on the work, and they were hoping to build the next lot in Westminster, where the W.W.H.C. had promised their co-operation in the management of the cottages when built.

PROPOSED NEW BUILDINGS & OTHER W

In these lists care is taken to ensure the accuracy of the information given, but sionally happen that, owing to building owners taking the responsibility of comm before plans are finally approved by the local authorities, "proposed" works a publication have been actually commenced. Abbreviations: T.C. for Town Council Urban District Council; R.D.C. for Rural District Council; E.C. for Education Committ Board of Guardians; B.C. for Borough Council; P.C. for Parish Council; M.H. fo Health; M.T. for Ministry of Transport; C.B. for County Borough; and B.E. for Board

New Scottish Schools.

rres Dean of Guild Court recently approved ls for the erection of a new school in that on at a cost of £18,000. Plans have also been d for the Fife Educational Authority by u haven Dean of Guild Court for a new mining hol, fully equipped, to be erected in Buckan, at an estimated cost of £5,000.

THE SCOTTISH BUILDER

NEW BUILDINGS IN SCOTLAND

Perth.—The Dean of Guild Court has passed plans for extensive alterations to the County and City of Perth Royal Infirmary. The extensions include the extension of the sterilising room in the operating theatre, the nurses' dining-room, and the drying room of the laundry.

Brodick.—Operations will commence shortly in connection with the repairing of the little harbour at Brodick. The Marquis of Graham has made arrangements for the renovation, and the dues exacted should maintain the financial position of the harbour.

Falkirk.—The Town Council is preparing a new scheme for the erection of 282 houses which are to be erected on the sites of previous housing schemes at Merchiston, Thornhill and Carmuirs, as well as on the Stirling-road and Union-road site, which was recently acquired by the Council. It was stated at the last meeting of the Council that it has been the custom to keep the housing contracts inside the burgh, but the progress had been so slow that it was suggested that a different system should be adopted this time and labour obtained from whence it was most plentiful.

Glasgow.—The Housing Committee of the Corporation have approved of a big slum clearance scheme, which will mean the provision of new houses for a population of 16,246 people. It is proposed to erect 4,143 houses under this new scheme, and the houses will be spread over 127 different areas, 87 of these areas will be reserved for purposes of open spaces, mainly the sites of back lands; 23 areas, when cleared, will have houses erected on them; and 17 areas will be devoted to the construction of business premises only.

Elgin.—The Town Council has decided to invite offers for the erection of three blocks of four houses, similar to those already erected at Maisondieu-road, on the remainder of the unbuilt ground between Maisondieu-road and Victoria-road. The Council are aiming to erect about 20 houses of the cottage type.

Stirling.—The Housing Committee of the Town Council has resolved provisionally to proceed with housing schemes for 100 houses, of which 25 per cent. will be room and kitchen. The sites which have been proposed are, Butt Well Park, alongside Raploch-road; Borestone-crescent; Raploch Farm; Drip-road; Rockvale Mills; Craigs; Bannockburn-road, West Side.

Fifeshire.—The need for more houses in Dunfermline is very acute and a report to this effect was submitted to the Dunfermline Committee at their last meeting. It is estimated that about 500 houses are needed immediately. The needs of the mining areas especially are very great, and it is proposed to attend to these immediately. The Public Health Committee suggest a scheme for 100 houses to be erected, comprising 60 at Kelty and 40 at Crossgates. It is also suggested that the Fife Coal Co. should be asked to continue their present building operations at High Valleyfield to relieve the congestion there.

GLASGOW MASTER BUILDERS

THE annual meeting of the Glasgow Master Wrights' and Builders' Association was held recently in Glasgow. Mr. Hugh D. Findlay, president, in the chair. The annual report stated that during the past year the position in the building trade had been slightly better, but prices were still being cut to such a degree that the profit, if any, was almost nil. On the one hand, the public was crying out for houses; on the other, the contractors were not nearly fully occupied. Repair work to property had also been better, but proprietors and house factors were still bound to be careful regarding repairs as their profit margins were extremely small. This would continue until the restrictions on property were cancelled and some settled policy adopted that would give the people confidence to invest their money in it with some hope of a return. Mr. James L. Cowan and Mr. Robert Brown were elected president and vice-president respectively for the coming year.

Scottish Architects.

A meeting of the council of the Incorporation of Architects in Scotland was held recently at 15, Rutland-square, Edinburgh, Mr. John Keppie, F.R.I.B.A., President, in the chair. Reports were submitted by the Practice Committee and the Housing and Town Planning Committee. There were admitted to membership one Associate and four Students. A frame drawing of the Wallace Monument, Stirling, designed by the late Mr. G. T. Rochead, F.R.S.A., Glasgow, was presented by Mr. H. R. Williamson, architect, Edinburgh, and there was also presented by Mr. R. G. Wilson, jun., architect, Aberdeen, a portrait of Archibald Simpson, an early nineteenth-century Aberdeen architect, being a steel engraving by the late James Giles, R.S.A.

Victoria Infirmary.

Additional accommodation to Victoria Infirmary—for which plans were prepared in 1914, but discontinued owing to the war—is now in course of construction. The new pavilion, with its adjuncts, will involve an approximate expenditure of £100,000.

Roman Architecture.

A lecture on "The Roman and Italian Orders of Architecture" was recently given at Glasgow University, under the auspices of the Workers' Educational Association, by Professor Charles Gourlay, of the Royal Technical College, Glasgow. Professor Gourlay said that Roman architecture began with the conquest of Greece in 146 B.C., and lasted until the transfer of the capital of the Roman Empire to Constantinople in A.D. 328. Its full magnificence was displayed during the reign of the Emperors between 50 B.C. and A.D. 328, but the most defined work was done during the Augustan age, although there were culminating periods during the reigns of Trajan, Hadrian, and Antoninus Pius, when splendidly conceived buildings were erected.

UILDING TRADE WAGES IN SCOTLAND.*

The following are the present rates of wages in the building trade in the principal towns of cotland. Every endeavour is made to ensure accuracy, but we cannot be responsible for errors at may occur:—

	Masons.	Brick-layers.	Carpenters, Joiners.	Plasterers.	Slaters.	Plumbers.	Painters.	Brick-layers' Labourers.	Masons' Plasterers' Labourers.

VILLIAMS & Co., LTD. (201,583). November 8. 61, Imperial Build- e-hill, E.C. Builders and decora- rnal capital, £100.

THE NATIONAL INSTITUTE OF PLUMBERS

THE National Institute of Plumbers recently held its half-yearly meeting at the Cutlers' Hall, Sheffield. The delegates were welcomed by the Master Cutler (Mr. W. W. Wood), who said that the Institute sought to maintain a high standard of efficiency in plumbing work, and took a keen interest in the training of apprentices. When so many skilled men were leaving this country because they could not find employment, it was of the utmost importance that the supply of technical and skilled men should be maintained.

A vote of thanks to the Master Cutler was proposed by Mr. R. H. Rowell, of Newcastle, and seconded by Mr. J. C. Smith, of London.

Mr. William Terrey, the general manager of the Sheffield Water Department, emphasised the point that only thoroughly efficient craftsmen should be allowed to do plumbing work. Unskilled persons should not be allowed to jeopardise public health by meddling with that of which they were not complete masters. In these days there was a tendency to make first cost and profit the main consideration, but in plumbing that was a tendency which was disastrous both in the interests of the plumbers and of public health. They were in the midst of great housing activity, and special emphasis should be laid on the need for theoretical and practical tests for those engaged on the important work of plumbing and sanitation. Health, protection against fire, and the general safety of the people depended largely upon the maintenance of an adequate water supply, and sound plumbing work contribute largely to this result. It was a weapon of no small importance in the struggle against disease in all its forms.

INDUSTRIAL HOUSING

A NEW form of industrial housing has been originated in the United States. The houses under this scheme are all detached, but sufficiently large to accommodate two families. The reason is that it has been found that the purchasers like to have tenants. For a house of the size now being built, the buyer rents out one of the apartments, and the rent helps to pay off his first mortgage, and in time he becomes the sole owner. After that the extra remittance brings in a regular income. Thirty-five of these two-family houses have been erected. Each house covers an area 35 ft. wide by 100 ft. deep. Gas, electricity, and separate heating plant are laid on. A porch, enclosed by glass, so as to make what is known in America as a "sun parlour," is included. On the first floor is the vestibule, the enclosed porch, a hall, living-room, dining-room, kitchen, two bedrooms, and a bathroom. The second floor has a third bedroom over the porch. The cost of each house is 11,750 dollars—a sum that is said to be far below normal prices. The first block of 35 houses was completely sold out before completed, and many of those who secured homes have already received far higher offers than they have paid. A special company, with a board of directors, is responsible for the financial control of these houses. Shares in the company, of the par value of 10 dollars each, are sold only to employees, who can pay by a deduction from the weekly earnings. Thus the capital has been provided and the employees have in the shares valuable securities, on the strength of which they are able to buy one of these houses.

Derby Commercial Scheme.

A contract has just been arranged by the architects, Messrs. Naylor, Sale & Woore, for the erection of a block of shops to be erected at the Market Head, Derby, at a cost of about £28,000. The builders are Messrs. S. Gee & Sons, Ltd., Derby. The constructional steelwork is to be provided and fixed by the Fawcett Construction Co., Ltd., Westminster.

THE BUILDER

JOURNAL FOR THE ARCHITECT AND CONSTRUCTOR.

WITH WHICH IS INCORPORATED "THE BRITISH ARCHITECT."

L.—No. 4271. DECEMBER 12, 1924.

SAVE THE CITY CHURCHES

THE controversy over the future of the City churches will shortly reach its climax. Probably the majority of architects and others who are interested in these buildings as monuments of art are by now thoroughly fogged as to the position in which we stand. This has o lucidly explained by Sir Reginald Blomfield in his letter e *Times*, of November 21, that we quote the following t: "The Union of Benefices and Disposal of Churches ppolis) Measure, 1924, was passed on Tuesday (Novem-3) by the Church Assembly by a very large majority. neasure deals (1) with the redistribution of benefices, ter with which the layman is not concerned, and (2) with pulling down or removal of any church,' and 'the sale posal of its site,' with which all who care for our beautiful hurches are very much concerned. The *modus operandi* is latter purpose appears to be as follows: In the first the Metropolitan Benefices Board is established, consisting cty members, of whom twenty-three are appointed by astical or quasi-ecclesiastical bodies, and seven by lay In addition, if the church is wholly or partly within y of London, four members are to be appointed by the Council and one by the L.C.C. Reckoning these five nal members as laymen, this gives twelve lay to twenty-clerical representatives. The Bishop, having marked his church, gives not less than one month's notice either Ancient Monuments Board or the Royal Fine Art Com-(it is not clear which), and to the Benefices Board. The t Monuments Board may advise the Benefices Board he value of the building in question, and the Benefices may, 'if in its discretion it thinks fit,' advise the Bishop rd to the recommendations of the Ancient Monuments ; or, on the other hand, it may put these recommendations e waste paper basket. After this, the Bishop appoints nission consisting of five members to enquire into and on the scheme. If the commission reports to the Bishop ur of the scheme, the Bishop may require the Ecclesi-Commissioners to frame a scheme in accordance with ort of the commission. Notice has to be sent to various and bodies named in a schedule, who shall have not less ree months within which they can appeal to the Bene-oard. If the latter body approves the scheme, the calls on the Ecclesiastical Commissioners to certify the and its approval by the Bishop to the Privy Council. right of appeal to the Privy Council within one month is , but in the face of the powerful organisation of the es Board, the Bishop, and the Ecclesiastical Com-ers, it seems very improbable that an appeal would be ful. If, on the other hand, the Benefices Board does prove the scheme, the scheme is dropped for the time, er an interval of five years the Bishop can set the ball again by appointing another commission. The destruc-City churches, which so far has proceeded in a somewhat manner, will, if this measure be passed, be regularised very dangerous principle formally recognised."

Reginald remarks that the measure was first introduced e report of the Phillimore Commission in 1919, and he us that if the recommendations of Lord Phillimore's sion were carried out only thirty of the parish churches g or rebuilt after the Fire would be left. The Bishop's contention that he has to choose between his respect for a beautiful building and his longing to save living souls is hardly justified. How can it save souls to pull down monuments of past religious zeal to make room for commercial buildings? In "Notes," in our issue of November 28, we suggested that such a contention amounts to an admission that the Church of England is a dying institution, and this we do not believe.

It is unfortunate that the sale of these churches and the necessity of reducing the cost of their upkeep should be so much associated with their destruction. We all admit that things cannot go on as they are, but there are numerous alternatives to pulling the churches down. We prize them not only as the creations of our greatest architect, but as witnesses to spiritual life in a great city. If they were sold, subject to safeguards as to their retention, to other religious bodies, or to suitable secular bodies, such a course could not reasonably be objected to; neither could the most exacting churchman object to their use for secular purposes when the same churchman is prepared to see these consecrated sites used to accommodate offices and warehouses. The site values when the buildings are demolished would in any case be much less than may be imagined, because they would be subject to rights of light in every direction.

Supposing that these churches had been old Gothic buildings, would we hear so much talk about pulling them down? One doubts it. Wren's architecture is little appreciated by the ecclesiastical mind to-day, and the architect's grievance is that it is wrong for their fate to be left ultimately in the hands of ecclesiastics, who are laymen where architecture is concerned. As regards reasonable alternatives, why is it not possible for the Church to press for the inclusion of many of these buildings in the list of Ancient Monuments, to be kept up as such? If St. Vedast's, St. Magnus, St. Anne and St. Agnes, St. Nicholas, St. Mary-at-Hill, and St. Dunstan-in-the-East, were taken over and the Church relieved of all responsibility concerning them it would ease the burden materially and save these six fine buildings from the destruction to which the Commission of four years ago attempted to consign them. If the State in some way made itself responsible for these six, the City of London might itself relieve the Church of the burden of six more, and the Church's difficulties would thus be removed. It will be argued that, even if the Church were relieved of upkeep, it would still be without what it needs most—money locked up in the sites. The value of these sites represents an unearned increment, on the enjoyment of which the Church should be the last to insist, lest it be open to the charge that it is as greedy of gain through the more speculative of commercial methods as commerce itself.

The piecemeal destruction in the past has been bad enough; under it we lost seventeen churches; but if the Church, which already commands such powers of destruction, is still unsatisfied, is it astonishing that we should be alarmed at the possibilities that await us in the future, when the power to destroy is immensely increased? We sincerely hope that Parliament will give expression to the determination of the mass of architectural and instructed opinion and refrain from handing over such arbitrary powers to those who neither by training nor knowledge are competent to decide upon the future of our great national monuments.

NOTES.

The President of the Royal Academy.

We regret that it is necessary for Sir Aston Webb to resign his Presidentship of the Royal Academy owing to his having passed the age-limit. The Academy was fortunate in his appointment to its presidency, for in all his official capacities—and they have been numerous and varied—Sir Aston has always exhibited fine qualities of tact, sense, and imagination. These are things which do not always go together, but in such matters as have been the main business of his life they have given Sir Aston Webb an influence which few attain. We are glad to know that he is now back in active work.

Town and City Development.

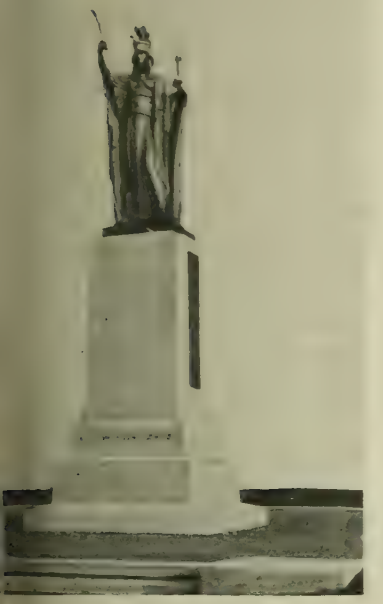
The great importance of foresight and imagination in regard to the future development of our towns is continually being impressed on our thoughts. We have just now been confronted by the more or less imminent sale of the Foundling Hospital, with its large acreage of land set free, the surprising suggestion for traffic roads through the parks, the possibilities of some fairly exhaustive consideration of the Thames bridges, and possible drastic action, and the possibilities which underlie future changes in the Broad at Oxford. Such considerations, with all the possibilities for good or ill which face us in the not distant future, call for serious and active work by such bodies as the London Society, whose great aim is to make our towns and cities more beautiful, more convenient, and more worthy of our modern civilisation.

Roads Across the Parks.

The proposal to make use of the public parks for new roads will, we feel sure, call forth strenuous opposition. In fact, we should hardly suppose it to be put forth seriously. From the interminable hustle and roar of the streets the parks offer us almost the only refuge and quiet left, and contrast with and compensate for the endless unrest of the crowded thoroughfares. The charm and seclusion of St. James's Park would be lost were a road driven, as has been proposed, right through it from Buckingham Palace to Piccadilly. It is also very doubtful whether much traffic pressure would be relieved thereby. In a letter to a contemporary, Mr. Geoffrey Faber says, with great truth, "The value in a city, such as mechanical transport has made" of London of these large areas free, or nearly free, from the noise and the smell "of motor traffic is beyond computation." Life would cease to be endurable in London, and lose what is almost its chief attraction, were the parks drawn into the welter which mechanical transport has created. The Home Secretary appears to us singularly ill-advised in suggesting that any adequate solution of the traffic difficulty is to be found in cutting up the parks.

City Improvements.

The Foundling Hospital is to be removed, and the property is, we believe, already sold; and it appears to us that the rightness or wrongness of such changes altogether depends on what spirit and purpose the site thus acquired is made use of. We are sorry, as all must be who ha familiar with this old and very landmark, that it should be tak us; but it is difficult to decide t altogether undesirable, the requi of London being so much altered. Oxford, on the south side of "The opposite Balliol College, a row shops, the leases having fallen in danger of replacement. One po the property has already been so unless the owners of the property— case, the City of Oxford—make conditions in their covenants in to rebuilding, the owners of the p can put up any building they It is evidence of the existing ana our urban conditions that this sh so; that property situated in the sity part of the town is in peril kind of use which the owner's interest directs him to make of it, therefore, important for the City of to respect its obligations to the a of an ancient city, already gr disfigured by the vandalisms suffered in recent years. Othe cinema house may be erected o Balliol College, or the municipality ing to increase its rates, may en the erection of great buildings, d all the surroundings. Best of all, possible, for the University to b property, so that it may be reta University use.



The London Building Act.

Those interested in ing construction in will be looking forv the report which M ham Forrest, Architect to the County Council, is preparing

Lancaster War Memorial. Messrs. Thomas H. Mawson & Sons, Architects.

[Unveiled recently at Lancaster, the bronze figure was executed by Messrs. Martyns, of Cheltenham, the bronze panel by Me Singer, of Frome, and the stone work by Mr. Arthur Tomsy, of Lancaster. The stone is "Stancliffe."]

Troon War Memorial.

MR. WALTER GILBERT, Sculptor.

[The bronze figure is 10 ft. 6 in. high, standing on a granite pedestal, 13 ft. high.]

of the two months' visit to the d States from which he has just ned. It will be admitted that the n Building Act is in need of amend- to bring it up to date, and it was the object of investigating modern ng methods in America with a view certaining how best the London ng regulations could be revised to them into line with developments in uctional methods that the visit ndertaken. We understand that opham Forrest is more than ever nced of the necessity for the removal anomalies in the Act which hinder ogress of London. Theatres, hotels, s, railway stations, traffic regula- and small houses have all been d by him, and he will no doubt some valuable recommendations ese subjects to make in his report.

---

erican pressions.

MR. TOPHAM FORREST has brought back many impressions from America, and is of the opinion that we have to learn from that country. In ional buildings and their equip- he thinks America is far ahead of nd the same applies to theatre ng and means of escape in case of The latest New York "skyscrapers" thinks, extraordinarily fine archi- as regards detail, and those built he zoning laws came into operation ry fine compositions as a whole. lanning of railway stations, too, ried out wonderfully well in the d States, where the architect is considerably helped by the fact that in most cases the tracks are below ground level. There is at least one subject, however, in which we are in advance of the cities of the United States, and that is in slum clearances, although the fittings and domestic appointments of American tenements are generally far superior to anything found in this country in similar classes of dwellings. Concrete is used considerably in America for small houses, and Mr. Forrest says he wants to employ concrete to a much greater extent for the thousands of new houses to be built by the L.C.C.

Higher Buildings.

ALTHOUGH Mr. Topham Forrest thinks very highly of the New York "skyscrapers," he does not foresee their adoption in London; nor, indeed, does he desire to. "I never wish to see 'skyscrapers' in London," he tells us, "and I do not think we shall ever see them. I never want to see London look like New York, but that is a different thing from allowing slightly higher buildings in London."

The Fine Arts in Ireland.

WE note that a Fine Arts Course in a Free University has just been instituted in Dublin under the direction of Count Plunkett, Hon. A.R.I.B.A. We understand that, after dealing with the general theory of art, this course proceeds to examine the progress of the arts in Ireland, beginning with metal work and primitive architecture in Pagan times. Subsequent lectures deal with the gradual changes and developments of the arts after the coming of St. Patrick, and the assimilation of Christian ideas from other nations, showing the persistence of racial methods and styles. Ireland is rich in early architecture, and the course of study, which includes the Romanesque churches, round towers, crosses, and incised slabs, with their relationship to similar work elsewhere, should be extremely valuable. The course is to carry on to the present day, and we hope that it will help Ireland to mould a modern architecture expressive of her own needs and aspirations. She can learn a good deal from England, but let her beware what she learns!

Clonfert Cathedral, Ireland: West Doorway.

GENERAL NEWS

Professional Announcements.

The address of Mr. Edwin J. Dod, A.R.I.B.A., is now Cunard Building, Liverpool.

The firm of Messrs. William Hill & Son has been dissolved as from November 1. Mr. Victor Bain, A.R.I.B.A., who was a member, is continuing in practice at 38, Albion-street, Leeds.

Manchester Infirmary.

The Public Health Committee of the Manchester Corporation recently decided to proceed with its proposal for a big extension of Abergele Sanatorium. The scheme is to provide 546 more beds for children, at an estimated cost of about £180,000.

Aberdeen Building Scheme.

Plans for the erection of buildings at the cost of £10,000 by the Royal National Mission to Deep Sea Fishermen, at the corner of Palmerston-road and Market-street, Aberdeen, were passed recently at a meeting of the Lands and Fishing Committee of Aberdeen Harbour Board.

Rotherham Technical College.

In connection with the proposed erection of a technical college and school of art on a site in Howard-street, the Rotherham E.C. recommend that architects be invited to submit competitive designs, premiums to be £200, £100, and £50. It is suggested that an assessor should be nominated by the President of the R.I.B.A.

William Booth Memorial.

Messrs. Fleetwood, Eversden & King, F.S.I., surveyors, of 3, New-court, Lincoln's Inn, W.C.2, have been appointed quantity surveyors for the William Booth Memorial Training College, which is to be erected shortly at Denmark Hill, at an approximate cost of £250,000. The architects are Messrs. Alex. Gordon and G. Morriss Viner, with Sir Giles Gilbert Scott, R.A., consulting architect.

In Memoriam.

A memorial service for Sir Thomas Graham Jackson, Bart., R.A., was held at 2.30 last Monday, at St. James's, Piccadilly. In the congregation were Sir Aston Webb, P.R.A., Sir Reginald Blomfield, R.A., Sir George Frampton, R.A., Sir William Goscombe John, R.A., Sir John Burnet, A.R.A., Viscount Dillon, Sir D. Y. Cameron, R.A., Mr. Ian MacAlister (representing the Royal Institute of British Architects), Major Corlett, (representing the Australian Architects), Sir Hugh and Major Jackson. The Ven. C. E. Lambert, Archdeacon of Hampstead, assisted by Canon Monroe, officiated.

R.I.B.A.

At a general meeting of the Royal Institute of British Architects, held on Monday, December 1, the following members were elected :—

As Fellows (20).—A. Archer-Betham; A. E. Biggs; W. D'Arcy Cathcart; L. A. Culliford, F.S.I.; N. J. Dawson; G. D. G. Hake; J. W. Hays; E. F. Knight; J. M. Lethbridge; T. F. MacLennan; H. F. Murrell; G. Nott; W. S. Owen, M.A., P.A.S.I.; R. M. Pigott, M.C.; C. G. Ripley; J. Smith; H. Thornton, B.A.; S. Toy, F.S.A.; H. A. Welch; and E. B. Wetenhall, F.S.I.

As Associates (15).—C. K. Bhedwar; S. L. Blackburne; J. P. Blake, P.A.S.I.; K. A. Braden; C. H. Brightiff; A. A. V. Campbell; S. S. Careless; R. S. Cobb, M.C.; C. M. Cooper, M.A. (Oxon); R. S. De Burgh; C. G. W. Eve; A. G. Geeson; A. W. Hodges; E. Reily; and J. M. Wilson.

As Hon. Associates (6).—Frank Brangwyn, R.A., R.P.E., Hon. R.S.A.; E. D. MacLagan, Director of the Victoria and Albert Museum, South Kensington; J. C. Squire; Sir Charles Walston, Fellow of King's College, Cambridge, Litt.D. (Cantab.); J. Wells, M.A., Warden of Wadham College and Vice-Chancellor of the University of Oxford; and F. R. Yerbury.

As Hon Corresponding Member (1).—Ragnar Ostberg, Professor at the Royal Academy of Art, Sweden.

Hamilton War Memorial Competition.
Design placed First: By Mr. T. Harold Hughes, A.R.I.B.A.

HAMILTON MEMORI

The Hamilton War Memorial Com having invited designs for the p memorial, received in reply 45 sets o These were submitted to the assessor competition, Mr. George A. Paterson, P of the Institute of Architects in Glasgow award we announced in our issue of last

The site for the memorial was fixed so ago near to the main entrance of the park. The assessor's report congratula committee on receiving so many e designs, which showed a great variety o After carefully considering the selecti design placed first, he reported, was sim dignified in character, refined in det proportion, and embodied all that was e to make a permanent and satisfying me The style adopted reflected the spirit age, and was in sympathy with the tradi the district. The lay-out of the ad ground had been carefully considered.

The designs placed second, third and showed great originality in design and and thoroughly deserved the premiums

The author in submitting his design g following information :—

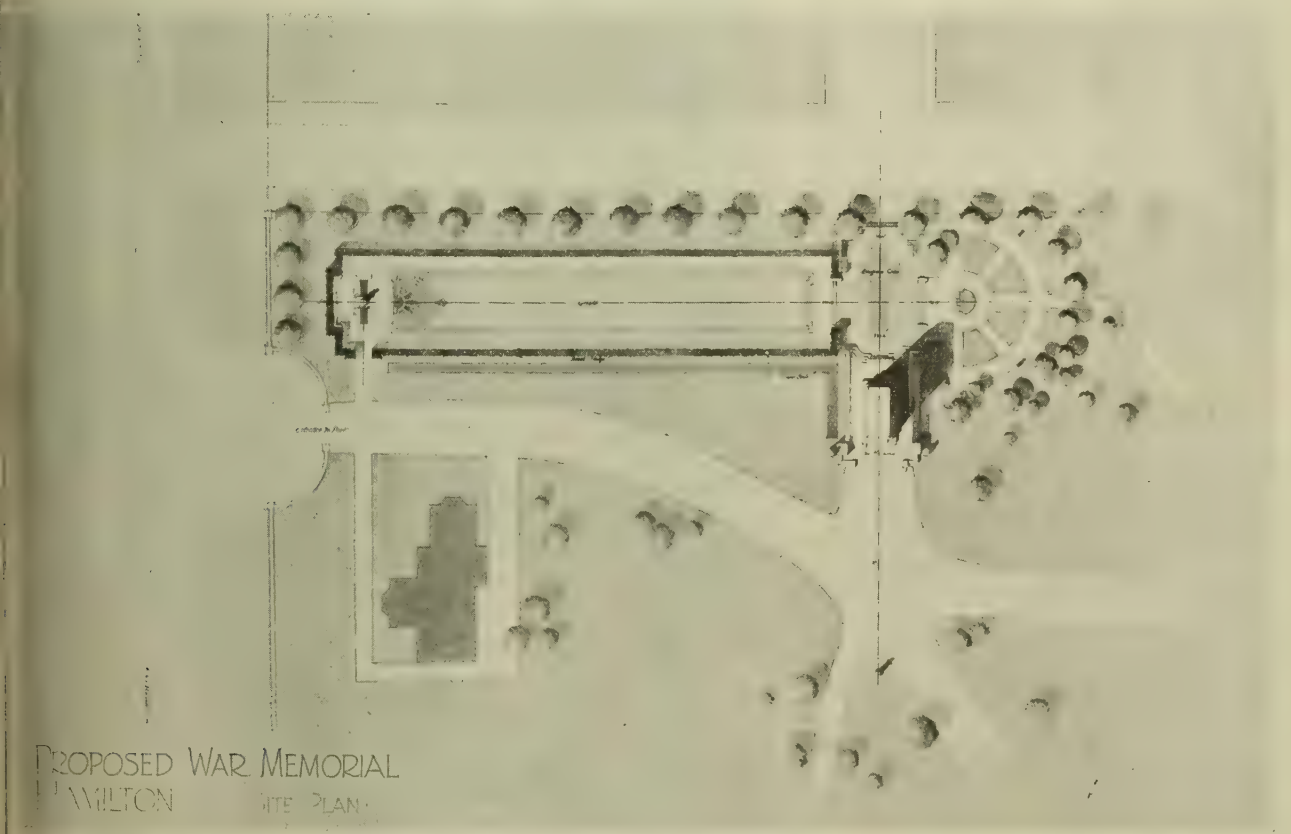
Site : "The memorial has been pla approximately the site indicated by th mittee. The main front faces north, ar suggested that on the main axis the gra on the opposite side of the drive mi deepened and a site fixed for a mast a for ceremonial purposes. To the back memorial a slightly sunk and paved ga indicated, the centre of which would be and flower plot of cruciform shape. Rig left of the main axis are formal garden to the east extending to the park bou its southern hedge forming a strong line with the flower bed, would lead up memorial from the entrance gates.

The Memorial : "The memorial tak form of a cenotaph with simple enrich and designed to accord with the archit traditions of the neighbourhood. On th a panel projects flanked by decorative leaves and with the arms of the Burgh in the centre. The dedicatory insc would be in large Roman letters deeply on this panel, and at the sides and ba names of important battles in which Ha men took part would be inscribed. The ing would be gilt. Provision for wreat been made by sinking the upper surface lower base and leaving a check to hold t position."

COMPETITION NE

The Constantine Technical College.

Architects are invited to submit desi this competition. Mr. Percy T F.R.I.B.A., has been appointed assesso conditions can be obtained from the Sec on the payment of £1 1s., not later than ber 27. (See advertisement this week.



Willesden Town Hall.

The Establishment Committee o Willesden U.D.C. has again had unde sideration the regulations issued by the R and its allied societies with regard to th motion and conduct of architectural petitions, and recommends the Council t these regulations and to at once consi question of asking for competitive des connection with the proposed new town

Other Competitions.

Other competitions still open include t lowing (the dates given are, first the sen date, and second the issue of *The Buil* which full particulars were given) :—M Hall (May 1). Manchester Art Gallery 28; Aug. 22). Offices at Nairobi (Fe Nov. 7). Jugo-Slav Landscape (Dec Nov. 7). Church at Southport (no sen date; Nov. 7). Argentine Institute Blind (Dec. 31. 1925; Nov. 28) Leeds (Feb. 16, 1925; Dec. 5). Valletta (June 30, 1925; Dec. 5).

Hamilton War Memorial Competition.

Design placed First: By Mr. T. Harold Hughes, A.R.I.B.A. (*See p.* 926.)

CORRESPONDENCE

[While we are glad to publish letters on professional and other matters of interest to our readers, it must be understood that we do not necessarily endorse the remarks of correspondents, who will oblige us if they will express their views as briefly as possible.]

The Queen Margaret Statue, Lincoln.

SIR,—It was a pleasure to see *The Builder* lending its aid to establish the claim of the Lincoln "Queen Margaret" to rank among the masterpieces of sculpture. I examined the statue at close quarters from Mr. Hodgson's scaffolding in September, and am assured that it belongs to the best period of English Gothic. Not only is there no justification for suggesting "restoration," but only the beauty of the queenly head gave rise to the belief. The "Margaret" is as lovely as the Torel bronze of "Queen Eleanor" in Westminster Abbey, and, in English sculpture, is of the same order of beauty as Donatello's "Saint George" or Michelangelo's "David" in Florentine art. The memory of these works adds point to Mr. Hodgson's plea that the "Queen Margaret" should be placed inside Lincoln Cathedral and replaced by a replica in the exterior niche next to the Edward and Eleanor statues. Both the Florentine statues were designed for the open air, but, in recent years, have been put under cover for their better preservation, the "Saint George" being represented by a replica in the niche on Or San Michele for which Donatello carved it.

There is a tendency to argue that because a stone carving has remained in a certain place for six hundred years, more or less unharmed, it may safely be left another six hundred years. This argument loses sight of the fact that when once the surface of a statue is lost disintegration proceeds very quickly. More damage can be done in fifty years than was done in five hundred years under original conditions. Already the hands and part of the lower draperies of the "Margaret" show signs of damage, though the head has lost none of its beauty. In the retro-choir at Lincoln, overlooking the site of the shrine of the well-loved Bishop Hugh, this glory of English Gothic sculpture would make its full beauty felt for many generations, whereas in its present position it is doomed to certain decay. The very fact that your article has been necessary to draw attention to this supreme example of English craft suggests that its present position is far from ideal. The graces of "Queen Margaret" have been hidden too long. To be appreciated they need to be seen, and that is not possible at present, though lovers of English sculpture will be tempted to the Cathedral Close in increasing numbers by Mr. S. Smith's beautiful photographs. In the retro-choir Edward's second Queen would be seen by every visitor to Lincoln, and her charms would become a possession of the many rather than the few.

London. ERNEST H. SHORT.

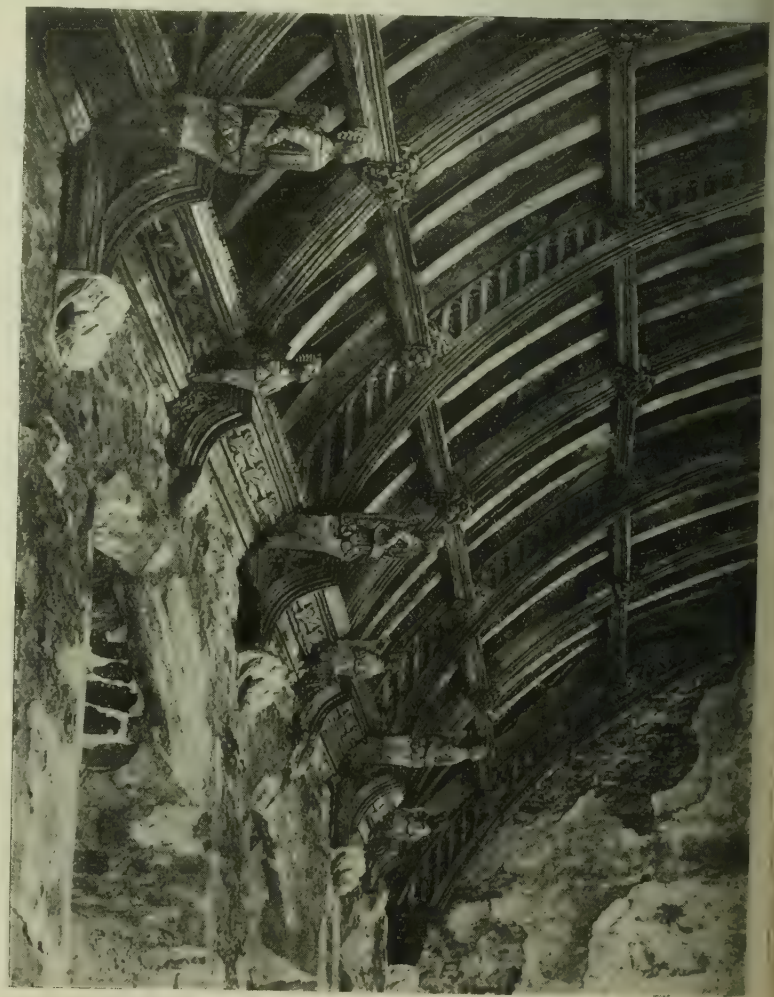
Local Museums.

SIR,—May I, through your paper, make a plea for the encouragement of local museums on or near sites of great archæological interest? I am aware that on the score of expense it is, unfortunately, probably useless to wish for representative collections on those sites where no museum now exists, but where they are already established it should be possible to make them really valuable to the student and pilgrim, and attractive and stimulating to the interest of casual visitors.

The present tendency seems still to be to carry off all the more interesting and beautiful objects—in fact, almost everything of value—to the British Museum or to other distant centres, where the better-known types are seldom noticed and virtually lost. It is, I think, a matter of common experience that the objects discovered about, say, the ruins of a Roman town or villa have a very much greater appeal if seen near the place where they were found than they would have in a great city museum. Surely this must be so to an especially great degree when, as in the cases of the castles of the Saxon shore, great ruins set amongst romantic and little-changed landscape help the least imaginative to reconstruct the past.

To take an instance that has been much before our notice of late. Richborough Castle, the Roman-British Rutupiæ, is a place of perhaps unsurpassed interest in the contemplation of that high civilisation in our land which reached its culmination in the days when Rome was decadent and which faded under conditions that baffle our studies in a fog of folk-lore and fable. Yet the museum in the castellum does not contain at all a representative collection of the very numerous objects that have been found here, even since it came under the control of H.M. Office of Works. Though well kept by a custodian who takes an interest and pride in her work, it is, relatively, a poor little collection. Many thousands of coins, covering most of the period and the mysterious transition that followed it, have been found about the site. There are, if I remember right, five coins in the museum. Two privately-owned coins, discovered long ago, just outside the preserved area, were borrowed by the British Museum officials two years ago under the promise that they should be returned to the curator of the Richborough Castle Museum after examination. Perhaps it would not be too much to hope that before long, out of its great stores, not only these two coins, but as complete a Richborough series as possible, including some of those minimi and sceattas which are of peculiar interest as belonging to a series some new example of which may yet help us to correct our theories of the beginning of the dark ages, might be returned for exhibition to the place where they were found.

Though the site of Rutupiæ is under State control, with an entrance fee, I noticed a form in the Museum asking for subscriptions of any sum, for the excavation work. I think that there are probably others besides myself who would be more anxious to make some small sacrifice for an alternative list to preserve spot objects duplicates of which the Museum possesses than to hasten on the excavation of a preserved area.



I only mention the case of Richborough as being one of those that have lately brought before the public attention by not the excavation work in the Press. The many other places, Roman and mediæval, the same conditions prevail.

BERTRAM C. G. SH

Waterloo Bridge.

At a recent meeting of the London Council, the following recommendation Special Committee on Thames Bridge agreed: "That the Council of the Insti of Civil Engineers be asked to express benefit of the Council their views on the qu whether, having regard to the present con of Waterloo Bridge, it would be practicabl reasonable to underpin all or some of the of the bridge, so as to render the structur manently safe and to enable it to be re to its original form."

In their report, the Special Committee that they had received a deputation fro Society for the Protection of Ancient Buil whose views were favourable to underpi as a safe, permanent, and economical re which could be applied to the whole of the with the exception of pier No. 4, and po pier No. 5. The society urged that an e ment should be tried on one pier. The mittee expressed the view that the C Council would be wise to ask for the assis of the Council of the Institution of Civil neers on the question of underpinning, in of the outstanding importance of the pre tion of the bridge.

Cleeve Abbey, Somerset: Refectory Roof.

ARCHITECTURAL EDUCATION.—III

By W. S. PURCHON.

E various schools of architecture in the sh Empire, while resembling each other ly in many particulars, vary in a number ays. While it is well that there should be general family resemblance, it will probably be considered well that there should be tions in certain details of the courses and methods of conducting them. It will be ly understood that the schools are subjected arious influences, some acting towards irmity, others towards variety. Among more important of the latter are various conditions, such as the regulations of ersities and other institutions, local opportunities for conducting special courses of struction, local architectural traditions (of using import with the development of the l system throughout the Empire), and the idualities of the members of the staffs of schools. The latter is perhaps the most rtant of the factors tending towards variety, ge, vitality and consequent development. while it may be argued that great improvements may, and do, result from the persistent ving of a uniform method, developments of mental importance are more likely to under conditions permitting of a considerable measure of freedom. Vitality is tially good, variety and change not sarily so; there is thus always a risk in the ing of additional freedom, but it is a risk worth taking. In the case of the recognised ls of architecture, the risk accompanying easure of freedom under which they work ply covered by the conditions under which students enjoy exemption from the inations of the Institute.

dealing with the various subjects of an ectural course, one point rapidly emerges; of course, the relative claims of art and ce. A very great deal—perhaps more enough—has already been written on this some urging the superior claims of art, those of science, and others, yet again, ing that the two are essentials, and that g essentials there are no degrees of import- In the latter apparently logical statethere is the possibility of the lurking y; it may be, for instance, that there are vo distinct things in question. One party ay that no matter how strong, useful and ry a structure may be, it is of no avail has not beauty, while the second party n reply that the converse of this is also As a matter of practice it will probably reed that, so far as the schools are con-l, while two types of mind—that of the and that of the scientist or engineer—e needed on the staff, the best results will ieved when the former is the dominating nce.

he early days of the schools in this country rious subjects in the course were frequently with little consideration of their relationto each other, only gradually did this nship become clear, and no clear-cut d of achieving a wise inter-relation of the s subjects has as yet emerged and been lly accepted. It is probable, indeed, there are various ways in which this end e reached, and there is even the possiof "co-ordination" being ranked among essed words, with the consequent risk of gration and obsession. The logically-d might perhaps start with Egyptian gs and study their design, construction, tion, &c., and produce designs in the ian manner. A repetition of this process h the various styles would finally result study of the various aspects of modern and the production of a modern design last term of the five years' course. Somehort of this is clearly indicated. We many would say we should—learn some-of the construction of famous buildings study the history of architecture, but at me time we should—again in the opinion ny—begin our studies of modern con-on as soon as we begin our studies of ancient architecture, and begin them with simple matters and gradually proceed to more difficult ones, while the history of architectural development will be found to be by no means a study of buildings in which the difficulty of construction gradually increases.

It is, of course, possible to make a good case for the basing of early design subjects on the historical periods under consideration at the time, but there are those who hold strongly that this method violates a fundamental principle, and that the notion of successive period designing should not be encouraged. Possibly the right approach to the whole subject of co-ordination of subjects lies rather in the direction of the investigation of "prerequisites." The main principle at the back of this method is the settling of the nature and amount of work which a student should undertake before he proceeds to a further stage, or before he undertakes a new type of work. It may, for instance, be argued that the student should attempt no architectural design of any kind until he has passed successfully through an outline course dealing with the whole of the main current of architectural development, and until he has similarly passed through elementary courses in architectural form, construction, mechanics, &c.

It will probably be found, again, that once design starts, it tends to outstrip construction, unless a deliberate attempt is made to retard rather than stimulate the imagination of the student. The latter may, for instance, introduce vaults and domes into his designs at a comparatively early period. He may, of course, be shown how they are constructed, but he will not be able to calculate the strength of such structures until a later period in his studies. Under the early method of co-ordination there was the temptation to produce graphic diagrams showing the stresses in such structures, before the student had had the opportunity of studying adequately the theory of construction.

It is of considerable importance, however, that each subject be studied on systematic and more or less formal lines; historical subjects proceeding in chronological order, constructional subjects proceeding from the simple to the more difficult, and subjects such as theory of structures gradually developing from first principles. This naturally leads to an apparent lack of co-ordination, but provided the lecture courses are kept within reasonable time limits, each of them dealt with on the clear understanding that it is leading towards modern design, and a proportion of the designs, as is normally the case, continued to the working drawing stage, the advantages would seem to outweigh the disadvantages. It may perhaps be argued that such a subject as Theory of Design could readily be largely dealt with in the courses on Architectural History, but such a suggestion would hardly be agreed to by the most vigorous advocates of co-ordination.

The main difficulty of co-relation arises in the early years of the course, and it may well be that we shall have to admit that during this early period the student is necessarily viewing architecture with a varying degree of clearness from various angles—historical, constructional, and theoretical—the latter both as regards design and also with reference to the calculations of strengths of structures. If, during these early years, each subject is studied and taught with a clear realisation of the end in view—the designing of modern buildings—it may perhaps be of little moment if his rate of progress along one approach (possibly a longer one) is more rapid than along another. Possibly at about the end of the third year the student will be able for the first time to see the building he is designing with approximately equal sharpness of vision from some three or four points of view. He may, for instance, be able to realise the historical developments which have made possible the style of his design, to give full details of the constructional methods he has adopted, and, if his design is a comparatively simple one, to calculate the strength of all its parts.

Another fundamental point which requires some thought before a consideration of the individual subjects of the course can be undertaken, is the question of dogmatic teaching. On the one hand it may be argued that right through the school course the student should be taught definitely and dogmatically, in order that he may have no shadow of doubt in his mind that the course he is following and the information he is assimilating are in every particular precisely accurate, and that any who may be following another path, no matter how slightly it may diverge from the true one, are preparing for themselves a hopeless future outside the pale. On the other hand, there are those who not only indicate to their students from the beginning that some of the views put forward are matters of opinion, but who also put before the student the opposing points of view. This divergence of method applies in the main to such subjects as Architectural History, Theory of Design and Architectural Construction; but even in such a subject as the theory of structures there is the possibility of indicating or refraining from indicating, the use of a variety of methods of solving a given problem.

The question is then, shall our teaching be entirely dogmatic, or entirely the reverse. Shall it be dogmatic in some subjects and not in others, or shall it be dogmatic in the early part of the course, and cease to be so in the later periods? These are interesting and important points, for whatever the method adopted may be during such a malleable period of the student's life, its effects will be long-lasting.

Closely connected with the above point is another almost equally interesting one. Should a student be encouraged to use his imagination and his inventive faculties right from the beginning of his course, or should there be a period of one, or perhaps even two, years during which his activities are entirely limited to the acquiring of information about the great works of the past and modern methods of construction, &c., and to the acquiring of facility as a draughtsman? If, for instance, architectural design is not started during the first year for the reasons previously given, it is at least a matter for consideration as to whether the students should work during this first year on simple design of a non-architectural type.

Allied to the above questions is the further one of the extent to which memory drawing tests can serve a useful purpose in the curriculum of a school of architecture. If, for instance, it is agreed that there are certain architectural forms which a student really ought to know—for the purpose of the argument it may be agreed that these forms are, for the time being, certain examples of the Greek, Roman and Renaissance orders—does it help the student to learn these forms if he has regular memory drawing tests dealing with them, and do such tests help him in other directions?

London School of Economics.

The following public lectures (open to the public without fee or ticket) on the Principles of Design have been arranged for 1925 by the London School of Economics and Political Science (University of London), Houghton-street, Aldwych, W.C.2. They will take place on Wednesdays, at 5 p.m.

January 14.—Introductory lecture, by B. J. Fletcher, Director of the Municipal Art School, Birmingham. 21.—"The Principles of Design as Applied to Buildings," by W. H. Ansell, M.C., F.R.I.B.A. 28.—"The Principles of Design as Applied to Textiles." Lecturer to be announced later.

February 4.—"The Principles of Design as Applied to Furniture," by H. P. Shapland, A.R.I.B.A. 11.—"The Principles of Design as Applied to Pots and Pans," by John Adams, late of the Pretoria School of Art. 18.—"The Principles of Design as Applied to Books and Printing," by Joseph Thorp. 25.—"The Principles of Design as Applied to Our Homes," by C. H. Collins Baker, Keeper and Secretary of the National Gallery.

March 4.—"The Principles of Design as Applied to Our Cities and Towns," by Frank Pick.

EXHIBITION OF AMERICAN WORKING DRAWINGS

A MOST interesting series of American working drawings has recently been on view at the Liverpool School of Architecture. These drawings have, for the large part, we understand, been collected and brought back by students of the School who, according to their excellent custom, have been working during the summer vacation in the offices of leading American architects, though one particularly fine set of prints has been presented to the School by Mr. Cass Gilbert. In such an exhibition as this, one is brought face to face with the fundamental differences between American and English practice. To the eyes of the English draughtsman unacquainted with American details, these drawings seem so overcrowded with information as to be unintelligible without the closest study. Upon investigation, however, several facts emerge to make the situation clear.

In the first place, it appears that drawings for presentation to the client are prepared to $\frac{1}{16}$ in. scale, together with an estimate of cost as, perhaps, is general in this country. When the scheme and probable cost are approved, work is started at once on $\frac{1}{4}$ in. scale drawings, and upon them practically every detail is carefully shown—steelwork, heating, plumbing, electric lighting, and vacuum installations, &c.—all indicated by means of symbols or a carefully devised system of *hachuring*. With the almost universal use of blue prints, colouring is unknown. In point of fact, these $\frac{1}{4}$ in. scale drawings seem of themselves sufficient for the carrying out of the whole job. Studies of various details, chiefly architectural as opposed to structural, are drawn out to $\frac{3}{4}$ in. scale and transferred to the $\frac{1}{2}$ in. Full size details are drawn out at the same time and everything is made to correspond. The $\frac{1}{4}$ in. and $\frac{3}{4}$ in. scale drawings are completely tied up with dimensions in every direction, minute fractions of an inch appearing in some cases to be accounted for.

While this work is going on, the specification writer in the office is engaged in drawing up the specification, and the steelwork expert, often also in the office, makes his calculations and prepares a separate set of details. When this work is all completed and not till then is the job sent out to tender. No bills of quantities are prepared, the contractor estimates, we understand, on a lump sum basis, or takes out rough quantities of his own. Of late, however, we learn that there is a movement on foot to introduce the English system of quantity surveying, it being thought by this means to get closer bids for work.

One can see at once the advantage to everybody of the architect having all his details worked out before the job is started. Much more time is, of course, allowed to the American architect for the work than is often the case here. It is held, and quite rightly we think, that progress is quicker that way, and valuable plant is not held up or a job kept waiting for further details to be sent along. Extensive alterations made by the client after the work is started must, of course, hold up the work very considerably, and one can only suppose that such alterations are discouraged.

Perhaps the most interesting set of working drawings in the exhibition was that by Mr. Cass Gilbert for the well-known Detroit Library, a building which is, probably, his masterpiece. One would say that these drawings represent the highest skill of the draughtsman's art, and there can be no doubt that the painstaking manner in which every detail is worked out and set down in its proper place in relation to the whole, contributed a great deal to the success of the building. Criticism of the working drawings for being overcrowded and fussy is easy, but the achievement, as illustrated by the photograph which accompanied the drawings, fully justifies the care expended.

The work of Messrs. York & Sawyer was illustrated by drawings of the Chester County Hospital. The most intimate knowledge of all hospital details was shown on the $\frac{1}{4}$ in. scale plans and sections, including the "cuspidor" in the dental room. It was noticed in this connection that all soil and waste pipes were carried down inside the cavity between the inner and outer linings of the external walls, a convenient way of disposing of them and, apparently, also a healthy one.

The Greenwich Savings Bank also by Messrs. York & Sawyer, was fully illustrated, the full size details for the interior bronze work being remarkably well drawn. The plan of the banking hall, it will be recalled, is in the form of a vast oval, a severe test for draughtsmanship. Here, again, all dimensions were fully figured, many, unobtainable otherwise, being calculated by trigonometry.

There were also included in the exhibition working drawings of the Bush Building in New York, by Messrs. Helmle & Corbett, together with several monuments by Van Buren Magonigle, including the famous McKinley Memorial. Amongst the working drawings of domestic work, drawn out with the same meticulous fullness of detail, were some residences by Messrs. Delano & Aldrich.

One is forced to the conclusion, after seeing such an exhibition, that there is the most intimate connection between the fine quality of the finished product of an American architectural office and the thoroughness and competency of the draughtsmen's work.

BRISTOL SCHOOL OF ARCHITECTURE

THE annual exhibition and prize-giving of the Royal West of England Academy School of Architecture took place at the Academy, Bristol, on December 1. Mr. Maurice Webb, F.R.I.B.A., who presided, said the school had made astonishing progress. When, last summer, the Travelling Board of Architects toured the country visiting the schools and reporting how they were getting on, and if they were good enough to receive exemption from the intermediate examination, they came from Liverpool, where the school was one of the largest and best. They did not expect Bristol had in three years reached the stage to qualify for that exemption, and they were, therefore, astounded at the progress made. The work of the school was fully up to the standard of others; indeed, it was better than some, and quite as good as any other. In its own particular class it showed up as well as any school at the London Conference on Architectural Education, and there was one drawing in the Exhibition which was universally admitted to be the best of its type, and it was the work of a Bristol student. Though the work of the school was satisfactory, the financial position was not; it was the only school of architecture in the West of England, from Liverpool to Land's End, and considering the importance architecture played in our daily life every encouragement should be given to those who took up that calling. It was hoped to raise an endowment fund and so put the school permanently on its legs.

Dame Janet Stancomb Wills presented the prizes, and advised the students not to be above consulting their womenfolk when preparing plans for houses, as the little details which men always overlooked made all the difference in a house. The new Winterstoke House at Mill Hill was beautifully planned because the Matron had been consulted by the architect.

The following were the prize-winners:—The Dame Janet Stancomb Wills Travelling Studentship, value £25, Mr. A. J. Saise; the Architectural Association design prize, value £5 5s., Mr. R. H. Brentnall; the R.W.A. Silver Medal and the B.S.A. prize of £3 3s., Mr. R. T. Green; the Savory Design Medal, F. Bowden; the R.W.A. Bronze Medal and B.S.A. prize of £2 2s., Mr. J. H. Bourne; the Headmaster's prize for the most marked progress, Mr. A. E. Powell. Special prizes for proportion were awarded to Messrs. W. J. Thrasher, Mr. H. Brentnall, A. J. Saise, and F. Bowden.

SOUTH WALES INSTITU OF ARCHITECTS

THE annual prize distribution and exhib of students' work of the South Wales Insti of Architects, Central (Cardiff) Branch, and Department of Architecture and Civic De at the Technical College, Cardiff, was recently in the Assembly Hall, at the Techn College.

The Chairman (Mr. T. Alwyn Li F.R.I.B.A.) referred to the excellent work by the Cardiff School of Architecture du the 4½ years that it had been in existe under the direction of Mr. W. S. Purchon, A.R.I.B.A., and thanked the City Cou through the Lord Mayor, for founding developing the School, and expressed the that before long it would be possible for students to work for University degrees.

The Lord Mayor (Alderman W. H. Pe bridge, J.P.), who distributed the prizes, pressed high appreciation of the valu services to the School of Messrs. Percy Tho F.R.I.B.A., Ivor Jones, A.R.I.B.A., Al Lloyd, F.R.I.B.A., and Harry Tea F.R.I.B.A., who have acted as honorary turers, and helped the School in nume other ways.

A vote of thanks to the Lord Mayor was posed by Mr. Percy Thomas, F.R.I.B.A., seconded by Mr. J. H. Jones, Secretary of South Wales Institute of Architects (We Branch).

In proposing a vote of thanks to the Chair Councillor G. Fred Evans undertook to before the next meeting of the University Co Council the suggestion with regard to award of Degrees in Architecture.

The South Wales Institute of Architects, Ce (Cardiff) Branch: Design, fourth year, prize, B. W. Thomas; second prize, W Oakley. Third year, first prize, V. Ba second prize, J. B. Wride. Measured Dra Prize, P. G. Budgen.

Department of Architecture and Civic De President's Prize for Draughtsmanship sented by Mr. Percy Thomas, F.R.I.B.A Banks; The Architectural Sketching (presented by Mr. H. Teather, F.R.I. J. B. Wride; The Architectural Constru Prize (presented by Mr. Sidney Willi F. W. Harper; The Batsford Prize for A tectural History (presented by Messrs. Batsford, Ltd.), E. B. Byrd; Civic I Prize (presented by Mr. Alwyn F.R.I.B.A.), D. J. Williams; The Wo Drawings Prize (presented by Mr. Ivor A.R.I.B.A.), V. Banks. Certificate in tecture (carrying with it exemption fro Intermediate Examination of the R.I.B. V. Banks (with distinction), James B. (with distinction), Harry A. Barton, Byrd, F. W. Harper.

MEETINGS

FRIDAY, *December* 12.

London Society.—Major H. Barnes on "B of London." 18, John-street, W.C.2. 5

Town Planning Institute.—Mr. F. Mars "Bradford Town Planning Schemes." Victoria-street, S.W.1. 6.30 p.m.

MONDAY, *December* 15.

Royal Institute of British Architects A. J. Davis on "Shop Fronts and their ment." At 9, Conduit-street, W.1. 8

Surveyors' Institution (Junior Section) F. W. Kuphal on "Town Planning in E Cities." 6.30 p.m.

WEDNESDAY, *December* 17.

British Society of Master Glass Pain Mr. B. Rackham on "Stained Glass Victoria and Albert Museum." At 6, square, W.C.1. 6 p.m.

Edinburgh Architectural Association. fessor L. B. Budden on "Future of Archit Education." At 15, Rutland-square.

THURSDAY, *December* 18.

Architecture Club.—Dinner. At Hotel Strand, W.C.2. 7.30 p.m.

THE ENTRANCE TO THE MAIN BLOCK.

THE MEMORIAL ARCH.

DETAIL OF EAST FRONT.

Clare College, Cambridge. SIR GILES GILBERT SCOTT, R.A., Architect.

New Nottingham Exchange Scheme.

This scheme, the illustrations of which we give this week, was unanimously adopted by the Nottingham City Council on December 1. The site comprises an area of approximately 4,260 square yards. On the western frontage is the Market-place, an open space of about five acres; on the Smithy-row frontage the site extends to the boundary of the land which will be occupied by the National Provincial Bank when these premises are rebuilt in connection with the widening of High-street. The site extends to the centre of the High-street frontage, with sufficient width to provide an entrance to the Arcade, with small shops on each side. On the Cheapside frontage the site extends from the building recently erected by the Commercial Union Assurance Company to the Market-place frontage, opposite Exchange-walk.

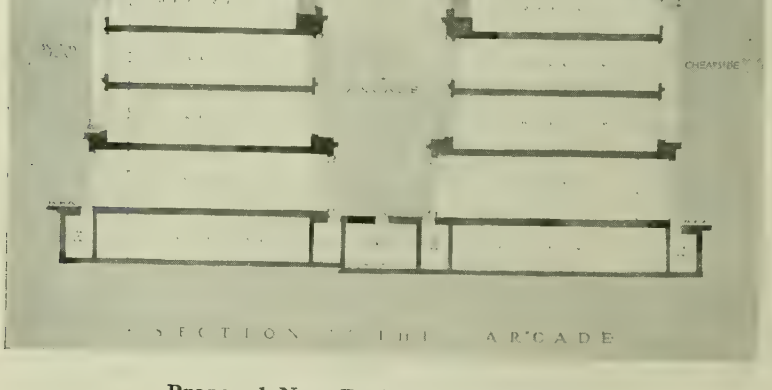
The widening of High-street will be continued at its new width of 60 ft. Smithy-row will be widened, the building line being improved; the very irregular frontage line of Cheapside will also be straightened, and the thoroughfare considerably improved. The site is of good proportion, and the scheme has been treated on bold and simple lines. The whole of the upper floors of the front portion of the site, west of the Arcade and facing the Great Market-place, together with adequate areas of the ground floor and basement, will be used entirely for civic purposes.

On the Great Market Place front a loggia treatment will be introduced, and the main entrance vestibule approached from this loggia will lead into a large entrance hall. On each side of this hall there will be controlled cloak rooms for ladies and gentlemen, and these cloak rooms will have private staircases leading to retiring rooms in the basement. Leading from the entrance hall will be the grand staircase hall, with its wide central marble staircase and electric elevators on either side.

The whole of the first floor on the western side of the arcade will be used for civic receptions. From the grand staircase a reception lobby will lead into the pillared reception hall (82 ft. by 42 ft.), stretching across the main front and overlooking the Great Market Place. In the front of the reception hall and leading from it there will be a wide open terrace with a Speaker's projecting balcony. At one end of the reception hall there will be a gallery for guests, and at the opposite end a musician's gallery with the necessary retiring rooms for artists. Leading from the reception hall and the grand staircase will be the dining room (56 ft. by 28 ft.). Overlooking Smithy-row, and approached from the grand staircase, will be the Mayor's quarters, which consist of a waiting room, the Mayor's parlour, and a private room. A large service room, served from the kitchens by electric lifts and a private staircase, will be suitably planned so that the uses of the dining-room and the reception hall could be conveniently reversed. Overlooking the main arcade will be the staircase leading to the second floor.

The second floor will be reached by two large electric elevators in addition to the staircase, and this floor will be used for the work of the Council. The Council Chamber will be situated on the main front, surrounded by a corridor and two lobbies for members. The chamber will have a seating capacity for 108 members, with space for the necessary officials. A gallery will be arranged for the public, and a special gallery with a private room will be planned for the Press. The semi-circular plan adopted for the chamber will have the advantage of placing the Mayor within a minimum distance of all members. The chief entrances to the chamber will be from the members' lobbies, and adjacent to the lifts there will be a private entrance for the Mayor. On the southern front there will be a large ante-room (39 ft. by 28 ft.), and on the northern front the members' room and library (39 ft. by 28 ft.). Surrounding the Council Chamber, small private rooms will be arranged, including small rooms for the Mayor, the Sheriff, and the Town Clerk.

The third floor will be planned with the necessary kitchens and administrative stores for the whole of the civic quarters. This floor will have two private lifts and staircases direct from the special entrances in Cheapside and Smithy-row.



The back portion of the site will be developed to provide the maximum amount of shop frontage. Two large shopping arcades of considerably greater proportions than any other arc in this country will be provided to give c munication between Smithy-row, Cheaps and High-street. The arcades will be 6 high, with an effective width of 28 ft.

The existing buildings on the site have a s frontage of only 390 ft., whereas the propo scheme offers a shop frontage of approxima double the present amount, viz., 753 ft. development on the lines suggested concentr the administrative work for the shops into basement, and allows the fullest value to obtained from the ground floor space. important point of an adequate goods entra for each shop will be dealt with by the introd tion of a wide subway under both the arca and from the subway an entrance to the b ment of each shop will be provided. The s way will be fitted with two extra large go elevators at the main entrances, and the use these could be restricted to certain hours if fo desirable. In addition, at the south-eastern co of the site in Cheapside there will be an incli road suitable for trolley traffic leading into subway. The whole of the space for shops the ground floor will be constructed so as to al the greatest possible scope in sub-dividing area, varying from the small lock-up shop say, 18 ft. by 15 ft., with a small basement, to a large shopping store of, say, 115 ft. by 50 comprising five or six floors in height. Betw the main piers, the shop fronts will be arran exactly as desired by the various tenants, a the internal divisions for the shops will be light as possible to conform with the usual insurance regulations.

The division of the site by arcades will ren the upper floors very suitable for showrooms offices, and this division will have the advant of giving a maximum number of front rooms compared with the usual development w internal wells or light areas. The outer w surfaces of these rooms will be arranged wit very large percentage of window space to ens a maximum amount of light and natural vent tion.

The building will be erected in Portland sto The shop fronts and the upper windows will in metal with uniform bronze letters on the sh fascias. The various apartments in the ci quarters will be finished in a manner to give correct expression required in each room. T whole of the building will be steel framed w fire-resisting floors.

Mr. T. C. Howitt, D.S.O., A.R.I.B.A., is architect.

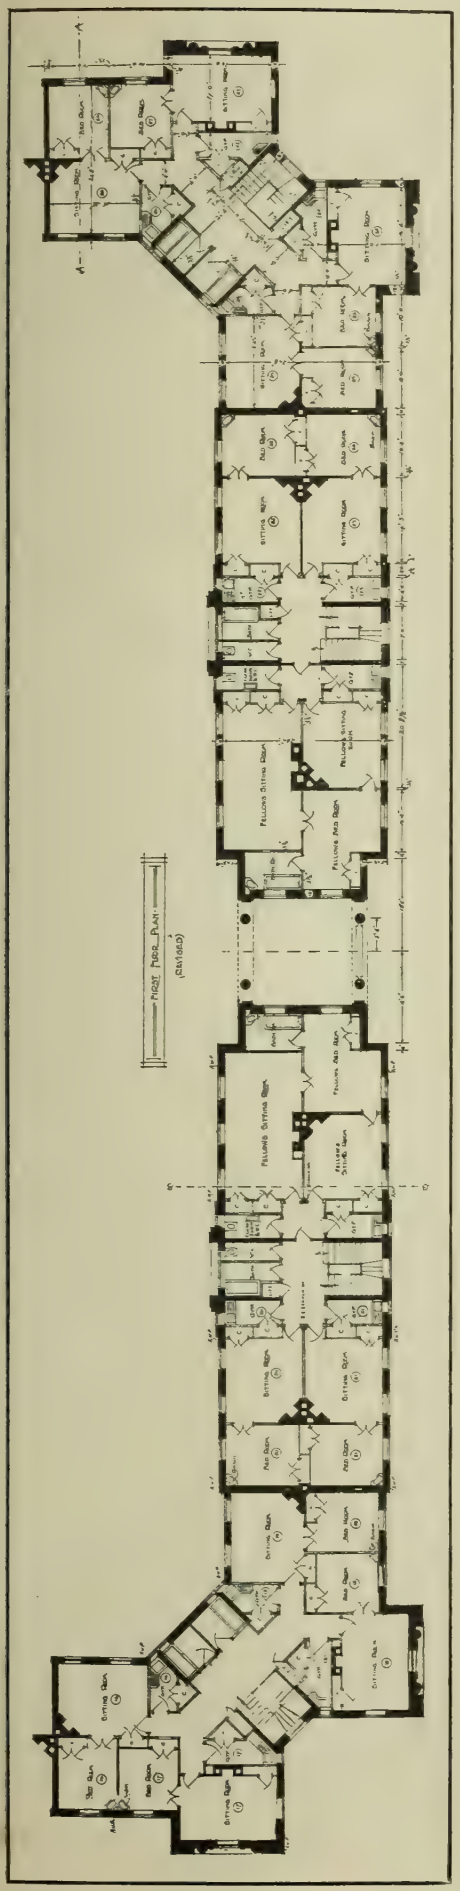
Proposed New Exchange, Nottingham.
MR. T. C. HOWITT, A.R.I.B.A., Architect.

Clare College, Cambridge.

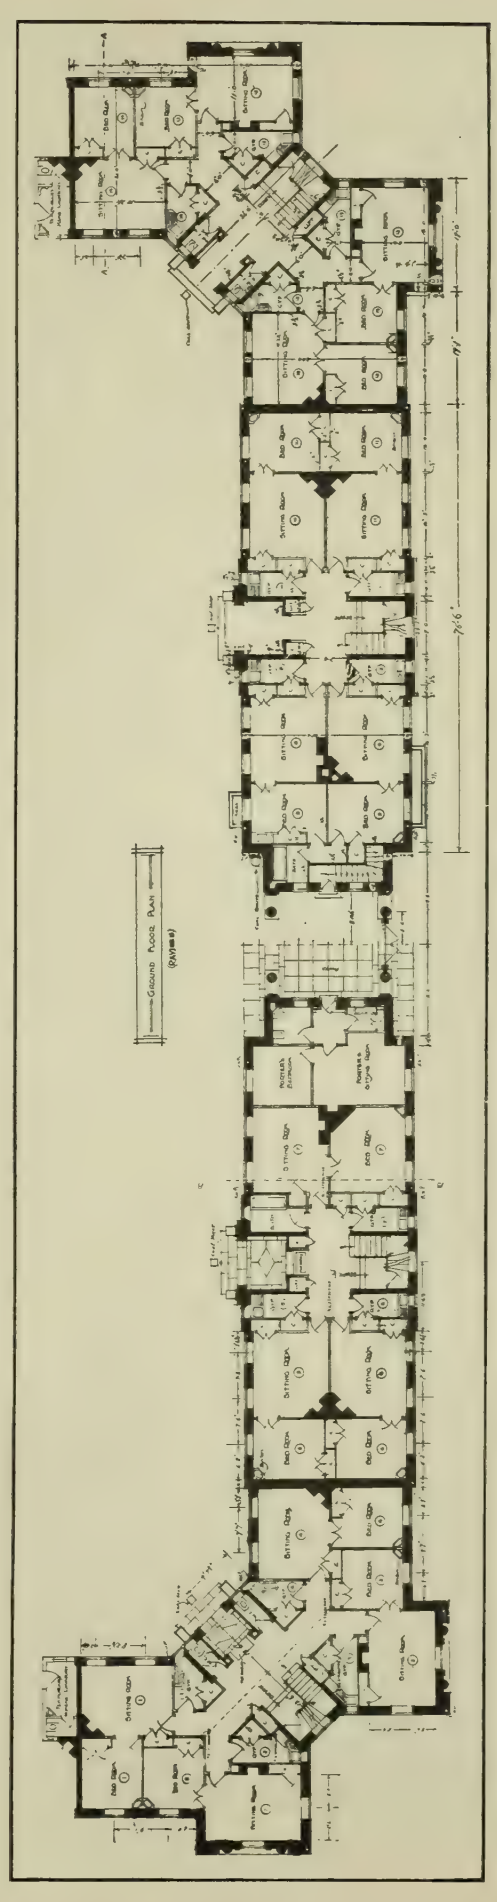
We give this week several illustrations of new memorial buildings at Clare Colle designed by Sir Giles Gilbert Scott, R.A. T form the first portion of a new court, m possible by the gift of £12,000 by Colonel A Banham, C.M.G., in memory of his son. new buildings were opened on Armistice I by Lord Balfour, Chancellor of the Univers and Visitor of the College.

Messrs. Coulson & Son, Ltd., Cambridge, the contractors.

Dundee School Competition.

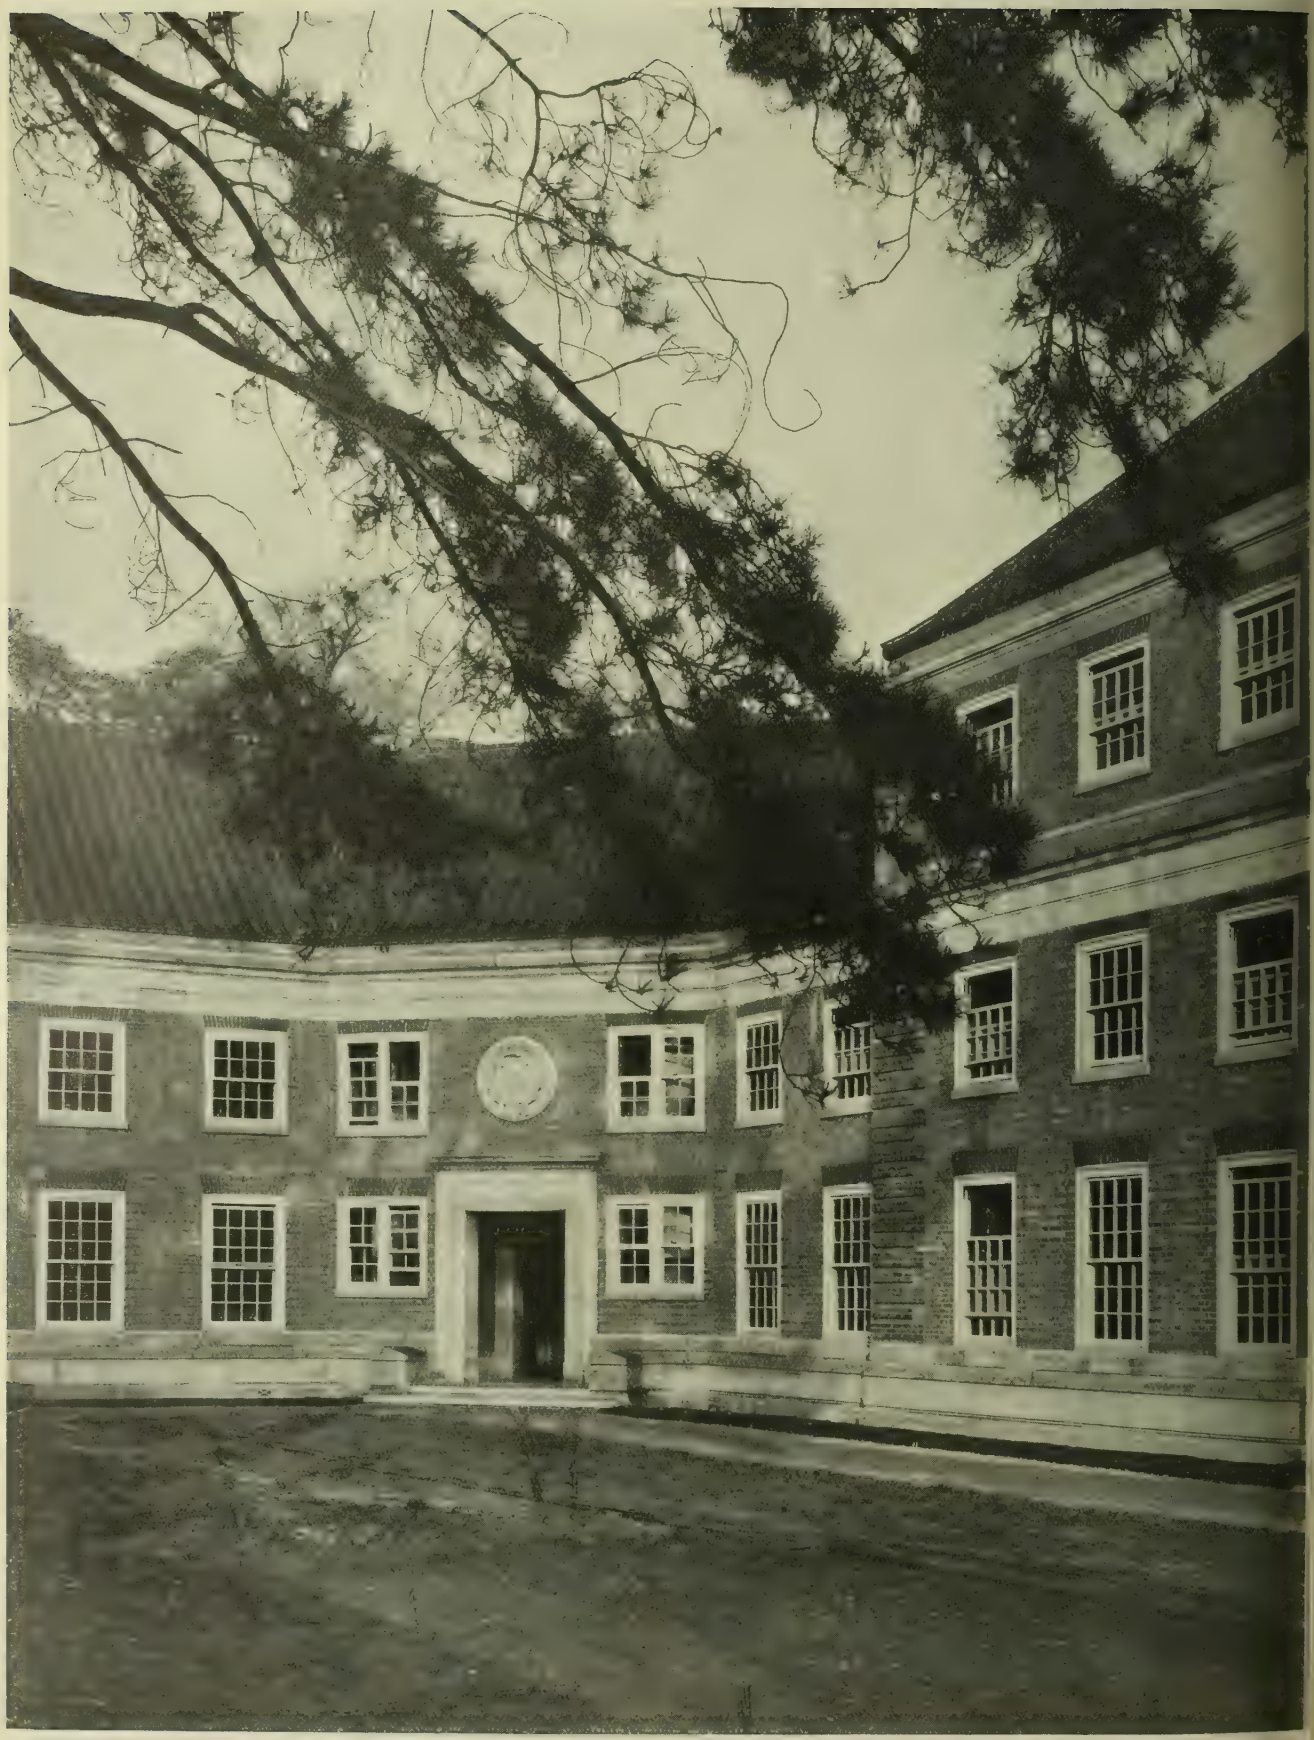


We give this week a perspective drawing the proposed new school at Dundee. T drawing is a perspective of the design submit by Mr. Chas. G. Soutar, F.R.I.B.A. (Mes Maclaren, Soutar & Salmond), and placed i in the recent competition. Other drawings this design were given in our issue for October



London Hotel Competition.

The sketch of the centre block of the propo "Royal" Hotel, Woburn-place, is part of design by Mr. C. A. Rowbotham, placed i in this recent competition. The length of hotel is some 700 ft. The original scheme to have been carried out in cream-white te cotta, but the actual facing material is now un discussion.



The Chenil Galleries.

In reference to our description of this worl our issue of the 28th ult., Messrs. Stuart's Gre lithic Co., Ltd., inform us that they w responsible for the cast stone-work to some the elevations.

WESTMINSTER ABBEY RE-EXAMINED.—X

By W. R. LETHABY.

MOSAICS AND STAINED GLASS.—PART II.

From many precise orders recorded in the iberate Rolls," it appears that Henry III a special love for stained glass. In 1237, instance, a command was issued "to make hamber with beautiful glass."

There is evidence to show that the King st have glazed his church at once with ined glass. Much of it was ornamental, for re work, as usual, would have been reserved special positions. Most of it, too, was very r, either "grisaille" just touched with nts of colour, or white quarry work. The ss was attached to wooden frames in the ts. Several window irons in the foiled les still retain "lugs" to which the leaded zing was attached by wedges, some of which ve actually been found. In two of the ceried compartments of the north walk of cloister such irons with lugs may easily be n. The early glass at Canterbury was fixed he same way. The window lights are of large le varying in width from about 3½ ft. in e to 5½ ft. in the north bay of the aisle of the th transept.

Grisaille.—Some precious fragments of the ginal stained glass, which used to lie in the orium, were in 1908 carefully framed and up in a window in the west aisle of the th transept. There are about 20 ft., being tions of three different patterns. They were en out of one of the south-east apsidal pels in Scott's time and show what the zing of those chapels was. Set up as they v are it is easy to see how the patterns were anged to fill the lights. (Fig. 1.)

When I gave some sketches of the details ore, I did not allow for the exceptional lth of the window lights; the patterns would e been arranged as in Figs. 1 and 2. This ubling of the units agrees with windows at isbury and elsewhere. Fig. 3 is a diagram the third variety. Full-sized drawings of

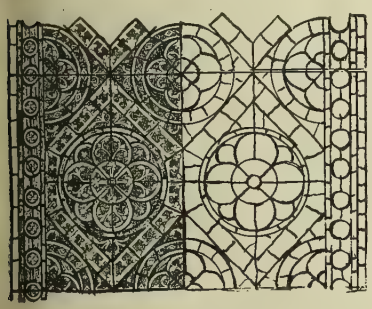

FIG. 1.

FIG. 2.

beautiful grisaille glazing made many years may be found in the Print Room of South nsington Museum.

Shields.—The glass now in the windows of apse, besides containing some late mediæval res, have backgrounds made up in part of gments dating from the thirteenth to the enteenth century. When these windows were en out in 1916, I was able to draw many ient quarry patterns and three beautiful lds. (This glass may now be studied in otographs sold at the Victoria and Albert Museum.) The three early shields of arms which now exist are those of Henry III, of his wife Eleanor of Provence, and of Richard of Cornwall

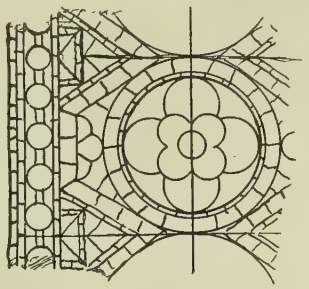

FIG. 3.

(his brother). They are about 16 in. high and are precious examples of the earliest heraldic glass which we have; they are probably twenty years earlier than the similar Salisbury shields. The King's shield is, fortunately, very complete, and so is that of Cornwall. Figs. 4 and 5 show these, and Figs. 6 and 7 are enlarged details. The Queen's shield is in worse condition, but

FIG. 4.

FIG. 5.

enough remains to allow of a drawn restoration being made. There were four red pallets on a gold ground. Three pieces of deep yellow glass, which are still associated with the red

FIG. 6.

stripes, are patterned a good deal like borders, and examination shows that they are, in fact, parts of the diapered golden field on which the ruby pallets were charged. In Fig. 8 the three upper pieces of diaper pattern are original. From records we know that such shields were set in the ground story windows, which we have seen were of grisaille glass; at Salisbury, some of the windows were practically copies of those at Westminster, and these had two shields to a light.

Sandford records that there remained many royal shields in the windows of the Westminster Church and Chapter House, and mentions particularly that one of Eleanor of Castile was in the aisle of the north transept. The ground floor windows, we may suppose, were mostly of this lovely kind of "jewelled grisaille," with pairs of shields set on the lights. In the British Museum (MS. Lansdowne, 874) are sketches of about a dozen of these shields on a sheet signed William Camden. Here, besides the three now existing, are England with a label (for Prince Edward); the castles and lions of Castile and Leon and the three bends of Ponthieu (both for his wife Eleanor); the black eagle of Germany (for his brother Richard of Cornwall); the cross and birds of the Confessor; and the three chevrons of Clare and the quarterly coat of De Lacy. Some were twice repeated. Fig. 9 shows the varieties other than the three existing ones. The selection of arms must mark a date earlier than the death of Henry III, and the three now existing in the apse windows were doubtless made before the consecration of the church in 1269. In the orders of Henry III shields of arms in glass are frequently specified.

Quarries.—Following a usual custom the clerestory windows were probably simpler than those below, as at Salisbury and York. In the much "made up" later glazing of the high apsidal windows are a large number of early fragments, including several varieties of thirteenth-century quarries. These, according to the early custom, are squares which were set diagonally. This is shown by analogy with examples at Lincoln, &c., and also by the fact that some of the pieces seem to have been half

quarries. One of these early quarries was found in my time at the clerestory level on or in the masonry. For similar quarries, see Winston, plate 31, Fig. 15. "The quarry is generally bordered on all or only two of its sides." These windows of diapered glass also

FIG. 7.

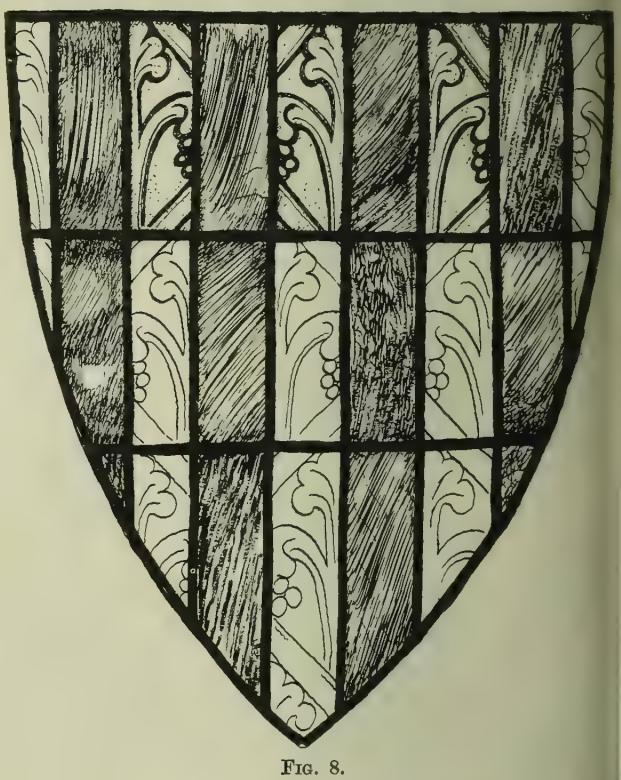

FIG. 8.

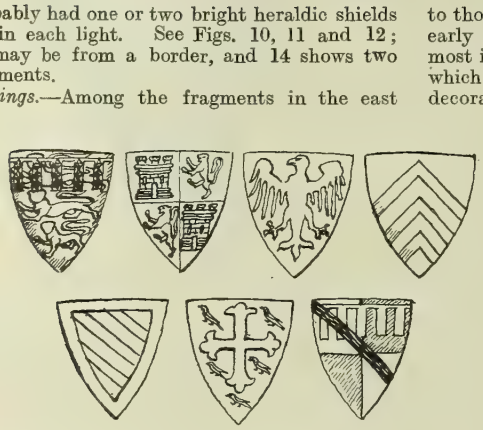
probably had one or two bright heraldic shields set in each light. See Figs. 10, 11 and 12; 13 may be from a border, and 14 shows two fragments.

Kings.—Among the fragments in the east



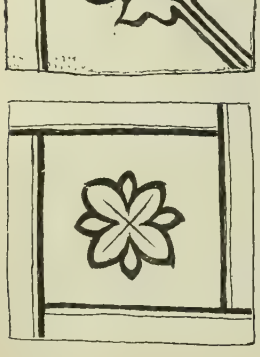


FIG. 9.

FIG. 10.

wndows are also some pieces of large crowns, on deep golden glass, which are certainly of mid-thirteenth - century style. Fig. 15 is a restoration of one of the crowns; three or four

to those on the circular bands are found on the early glass in Jerusalem Chamber. A further most interesting point is the form of the knops, which are roses. As we have seen before, rose decoration was a special characteristic of the work of Henry III; roses appear on his coins and the Chapter House inscription shows that he was a rose admirer. The large figures which wore these crowns can hardly have been anywhere else than in the apsidal windows, and we reach the conclusion that there was a King in each of the lights. Possibly they were the saint Kings of England, among whom Edward and Edmund would appear; or the founders, Edgar, Edward, and Henry III himself, may have been included. These figures would have

FIG. 12.

of the central knops and two or three of the low intermediate ones exist, but I have not found any part of the end knops. These crowns must have been 12 or 13 in. wide, and the figures which bore them can hardly have been less than 8 ft. high. Exactly similar jewel patterns

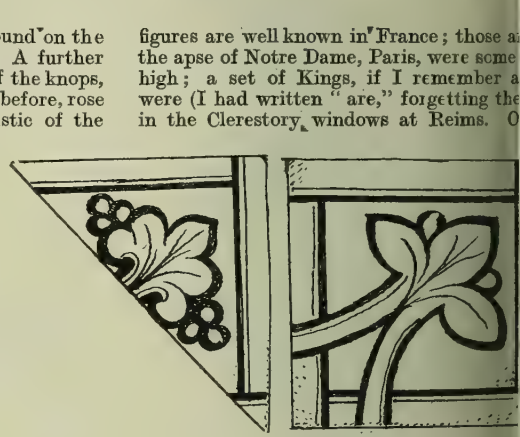

FIG. 11.

been named by inscriptions, and there is at one fragment existing in the present win of an early letter (R ?) which must have full 6 in. high (Fig. 16). There are also fragments of later naming inscriptions in letter as big or bigger. Such large sta

figures are well known in France; those a the apse of Notre Dame, Paris, were some high; a set of Kings, if I remember a were (I had written "are," forgetting the in the Clerestory windows at Reims. O

the figures at Westminster assuredly have been the C sor, and taking a large temporary painted head o white-haired King in the Cl at Windsor as a guide, I "see" him in his place ap ing above his golden coffin.

Medallions. — In Jeru Chamber are preserved, s its big northern window, pieces of the finest thirteenth-century med work with small figures. These pr panels are first described in *Archæologia*, but they must have been here long b

appear in an engraved view of the Chamber it was in the Strawberry Hill style, and ne of the panels (St. Nicholas) is scratched n. Miles, glazier, May 12, 1794." Now ne of the apsidal windows in the church cratched "Wm. Miles, No. 20 Tufton t, Westr., Repaired this, 1797." On the panel in the Chamber other glaziers have

FIG. 13.

heir names and the dates 1762 and 1746, on another (Murder of the Innocents) is en "Thomas Manning [?] glasd. this win. " Winston dated these medallions 0–70, and we may be confident that they part of the original glazing in place when nurch was consecrated in 1269. They are

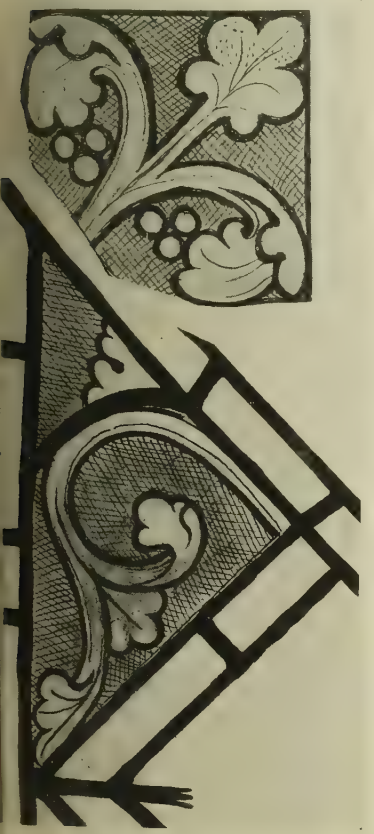

FIG. 14.

indows of big scale, and could only have rom a church of the first rank. The s show that they were parts of special ogical windows" in such a church. Two panels form a pair which would require from 4 to 4½ ft. wide, and the other ons associated in pairs (compare Fig. 1) be suitable for such lights.

The two panels, which make a pair, are of the form shown in Fig. 17, and they contain as subjects the Ascension and Descent of the Holy Spirit. In the centre of the former stands the Virgin with Apostles on either hand, and the feet of the ascending Christ appear above. The second panel has eleven Apostles with the head and wings of the descending Dove, from which fall red streams—the tongues of fire. The pair were bound together by a quatrefoil containing coloured foliage, and the filling

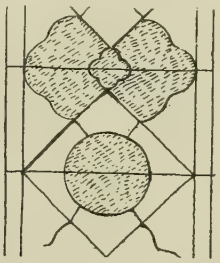

FIG. 15.

between the medallions would doubtless have been of the same kind. A third piece is a circular medallion (1 ft. 9 in. diameter) of the Resurrection. Christ rises from the Tomb holding a long Cross and having a ruby nimbus crossed with white. At the head and foot of the tomb is an angel, a very pretty pair, and

FIG. 16.

the whole is as good as may be. From the subject we may suppose that this medallion was associated with the pair just described; they may have been arranged as in Fig. 17. This type of arrangement is found in France and at Canterbury, Beverley, and Salisbury (Fig. 18). There are drawings of two or three of these

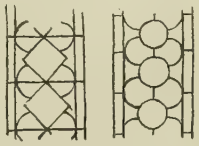

FIG. 18.

FIG. 17.

panels in the Winston collection at the British Museum, made in 1839–43, and these are valuable as evidence of condition before restoration.

The fourth and fifth panels are pointed quatrefoils about 2 ft. by 1½ ft. These contain St. Stephen's stoning and the execution of St. Paul, and they doubtless belonged to one light devoted to St. Paul or SS. Peter and Paul.

The sixth panel is a pointed oval, and contains the Murder of the Innocents. This belongs to the Infancy group of subjects, and probably occupied a separate light. A persecutor in one of the panels has a monk's head. Was this leaded up by mistake, as Winston supposed, or is it a craftsman's malicious joke?

The seventh panel is of similar form but different size; the subject is St. Nicholas and a drowning man, and it must be from yet another light. The sea is formed of wavy bands of blue and white.

These medallions all have blue backgrounds and ruby outer borders, with an inner strip of white pearling; nimbuses are red, green, yellow and white. Hems of the garments of Christ and Apostles have jewel patterns. Fig. 19 is a figure of the Virgin in the Ascension group.

In the later windows many small pieces are leaded in which may have come from "mosaic" grounds of medallion windows. Some medallions at Lincoln have similar borders to ours. One of these is illustrated by Winston with part of the surrounding ornamental foliage; such foliage would have formed the filling between our medallions. This glass must have been in some place of honour, possibly in the Lady Chapel or in the windows of the south transept directly opposite the gallery which, I suppose, was the King's pew. By comparison with Lincoln and Salisbury, we may form some imaginative thought of the fair interior full, flooded with light through windows mostly of pearly white heightened here and there to dazzling splendour of colour.

We probably learn who was the glazier of the church at the time of its consecration from a charter witnessed by Robert de Beverley (the mason), Edmund, goldsmith, and William le Verrer, in 1272.

Later Glazing.—In the east and west windows are several small fragments of fourteenth-century glazing, such as oak-leaf borders. Fig. 20 is from a piece of fourteenth-century grisaille found in 1907 over the vault of the south walk of the cloister. It may very well represent the glazing of the refectory as transformed about 1350–60.

The new work of building the nave was begun in 1376, but went forward very slowly, and it is doubtful if any glazing was done for nearly a century. In 1462 an entirely new

FIG. 19.

rose window in the south transept was glazed by Thomas Pedeler for 1½d. a foot, except for the arms of England at the centre in colour, which was 4s. In 1469 two glaziers worked 92 days glazing two windows of the nave (probably the aisle). Glass of "Rene" and English glass are mentioned; also a plate of *auricalco* (brass) for grinding colours, an "anelyng herth" and "papiro" bought for the glaziers. The next year Thomas, the glazier, worked 42 days, and in 1489 a glazier employed in the church is still called Thomas.

From 1506 to 1510 the windows in the

western part of the church were glazed. In 1505–6, 3s. 4d. was paid to a glazier coming from Malvern to see the windows. In 1507–8 Richard Twyge, glazier, received £37 6s. 8d. for the glazing of fourteen windows in the upper story of the church. In 1509–10, Richard Twyge filled the great west window with glass, for which he received £44, and also

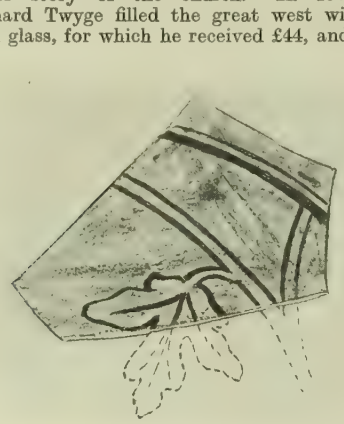

FIG. 20.

one window in the upper story for £3 (Rackham).

In April, 1643, Parliament appointed a committee to demolish monuments of superstition in the church. In May the copes were burnt. It was then used as a "preaching house," and bills for "cleansing out pictures" suggests much destruction of glass, although the only specific notice I find of this, apart from Henry VII's Chapel, is for 40 ft. of new glass in 1646 for a window next the "Redd-Door."

The nave at least retained many windows with figures up to the beginning of the eighteenth

FIG. 21.

century, but any within reach seem to have been of the nature of royal portraitures. Hatton (1708) says that the windows of the nave were "finely painted but now ruined. The windows were adorned with various portraits, of which there yet remain such at the east and west ends, and many on the south side in the upper range westward from the cross roof; and in the south-west window below is the portrait of Edward the Confessor."* Hatton's text may have been written just before the transfer of the figures of the Confessor and the Pilgrim to the apsidal end, or he may have followed Caxton's Chronicle, from which it also appears that there was a representation of the Confessor giving his ring on the south side. Dart (1723) states that the story of the Confessor had been in the glass of the south aisle, but implies that it was no longer there. Another of these windows, according to Sandford, contained a portraiture of Richard II with his badge of the White Hart.

Gathering together the large stained-glass figures into the east and west windows appears to have been done by Wren, when most of the church was largely reglazed from 1700 to 1722.

Edward Drew was the glazier, and in 1700 he repaired 34½ ft. of painted glass "in the Spiritual Court." In this year ironwork was put to "the eight windows over the altar." A board was provided "to draw out the glass," and also a model of one of the windows. In 1701 "the lights of old glass in several places" were "fitted up." Much glazing now and later was done in Henry VII Chapel. In 1703 Edward Drew was paid for 1,650 ft. of new glass "in seven windows over the altar or shrine: which finishes the east end entirely above at 9d." These must be the seven clerestory windows of the Confessor's Chapel, so it appears that the stained glass was not yet there. In 1704, nine new windows on the north side required 2,202 ft. of glass. In this year an item appears for "new leading the figure of Edward the Black Prince in the west window and putting a border and the College arms under the same." This was the west window of the south aisle. In 1705 new glass worth £42 was used "for the great west window with twelve figures of old painted glass." According to Dart, the glass in the big west window was fragmentary in 1723.

In 1706 £70 was paid "for 566 ft. painted glass amended at the east end of the church." This must refer to the three stained-glass windows in the apse. The lights are here narrower than the average, and 188 ft. for each window seems a full allowance. Names and the dates, 1709–11–13–35 are scratched on these windows, which are here easily reached from the leads. That they were there from the earliest date is confirmed by entries in 1716: "For mending painted glass east end that the boys broke." "Six frames for the wires for the three painted glass windows at the east end over the altar." It is interesting to find windows protected at so early a time; the Westminster boys were already at it! In this same year other entries occur as follows:— "Taking down the old glass next the cloister garden" "Figure work done over mason's shed next to the east door" [of Nave? this is under the heading Spiritual Court]. "Work done in the belfrey [lantern] for a painted window taken down from top of the church and fitted up."

The three eastern apsidal windows have six large single figures in as many lights. They are surrounded by work which even from below is seen to be semi-modern, but the whole is of pleasant colour for the glass of which the added work is made up is mostly ancient. Even the figures in the first window are of the semi-modern kind.

The figures in the two central lights are ancient (sixteenth century) and of fine quality and colour. They represent the Confessor giving his ring to St. John disguised as a pilgrim. The King stands before a green curtain in a blue robe and crimson mantle. St. John, with blue mantle, is in front of a crimson curtain. The colours of the curtains seem to have been counter-changed in the backgrounds above them. The figures were about 7 ft. high and their nimbuses 1½ ft. in diameter. They stood on castellated pedestals. On the garments the distinctive letters E and J are scattered.

These two figures are very fine of their kind, the King being developed portraiture, the faces and hair highly wrought, and the eyes in three-quarter aspect with high lights. There is an approach to perspective in the pedestals and the curtains bent back behind the figures. These lights have a German look, and the initial letters which powder the garments seem to be of renaissance character (Fig. 21). These letters and a coarse damask pattern on a robe are ground through flashed ruby into the white glass beneath. The other two figures ar late, but they are in a more conventiona painting manner. One looks like an Ap he is without headdress, carries a long sta seems to have had bare feet (a fragment is i in, out of place). The sixth figure is a bis mitred abbot, on his robes are letters E (po out of place) and C (?) ground into the fi ruby glass (Fig. 21). These two lights m nearly of the same date as the other However, the second pair of figures does no to have been done to range with the middle there are no curtains behind them ar pedestals for their feet.

In the work around the panels of a glass is a collection of fragments fro thirteenth to the seventeenth century. are several broken inscriptions. O Sanctus Greg . . . . . ecclesia . . . fragments which may have belonged tog are the tantalising words—

Regina M . . . . . me fecit R . . . therefo . . . anno re . .

Can these be Margaret, wife of Henry VI Richard Twyge, the glazier?

One fragment of inscription, Tho (Fig. 21), appears from the initial to be b same hand which ground out the bigger le

The making up of the glass to fit these is quite interesting, bold and workmanlik with an effort to harmonise new work wit place and the old figures. Mr. Drew shoul a place in the history of glazing.

A further record of the nave windows given to me about 1910 by Dean Arm Robinson. This is a photograph of a dra by Ashmole in the Gough Collection a Bodleian, of two armed figures. It is inscri "A draught of the pictures of St. George the Black Prince taken from a glass windo the South Isle at the west end of the Ch Westminster Abbey." There is no doubt the identification of the former, for his appeared in big black letter beneath. second figure still exists in a badly rep state with a new face in the S.W. tower it is good to have it authenticated. quoted Walpole (1762) for the identifica but objected that the armorial surcoat ha label. The label, however, was there whe drawing was made and the figure seems to been in perfect condition. It stands on a agonal base, which doubtless was the top pedestal somewhat similar to those under central pair of figures in the apse; which bably ranged with it and its companion.

These two figures—St. George and the Prince—certainly filled the lights of one win they match exactly; indeed they seem to been drawn by the "trace and turn o method. The St. George has gone whe glass goes, but the data are so full for thes figures that it might be worth while to a reconstructed drawing of them.

It seems from the evidence that the nave were glazed at a late time with a series of traitures of English kings and patron s Above in the clerestory may have been eccl tics, and the second pair of figures in the could have come from this range. In this they are probably the work of Richard T (1506-10), as may also be the figures o Confessor and St. John. The west windo the N.W. tower is made-up as a compani the Black Prince, but the figure here is lik semi-modern pair in the apse and was dou by Drew. Below it is a big portcullis wit chains and a handsome arched crown—a panel of Tudor work. From its scale this may very well have been in this light, is probably part of the work of Richard T (1506-10). There are other big badges i east windows which were probably transf from the west end.

Islip's Chapel, finished about 1530. stained window panes. In Keepe's MS. vo which I have, he says, "In the windows Chapell above, where several of the King Quenes of England are placed in Effegie in presses [the waxworks] you shall find some an Eye with the slip of a tree; then a g with the aforesaid slip, and sometime slipping from a tree with the wordes in a coming out of his mouth (I slip)." One of

memorial tablet to the Rev. Richard ter, of Kidderminster and London, was iled in Christ Church, Greyfriars, New-street, recently by the Rev. Principal E. Garvie, President of the National ncil of Evangelical Free Churches. The et was designed by Mr. R. Palmer Baines, Arc., of Messrs. George Baines & Son, itects, Victoria-street, S.W.1.

SHEFFIELD*

THE scheme, started in 1916 for the betterment of the city of Sheffield, has advanced as far as the production of an authentic monograph. In this book the need for scientific research in the handling of municipal problems is ably demonstrated and the exact science of town development is made clear. The task of collecting statistics and of preparing maps and diagrams has been under the direction of Professor Abercrombie, assisted by a competent staff well versed in local details. It is to be hoped that the municipal authorities, supported by the people of Sheffield, will lose no time in putting the excellent proposals into effect on the lines suggested. The book is divided into two parts. The first is a Civic Survey based on conditions as they exist to-day; while the second part centres upon ideas for the improvement of the city and the retention of its urban amenities. The book opens with the picture of Sheffield, framed in an historical background connoting geographical and geological facts. It gives the reasons for the selection of the site and the start of the town's prosperity as a manufacturing centre. As the Professor states: " The natural conformation of the ground upon which the city of Sheffield is built has been at once the origin of its prosperity and the prime determinant factor of its growth." Plate I shows a plan of the city in its relation to the hilly region on the west and the plain on the east, and further on in the book stress is laid on the geography of the district, the geology and surface formation, the coal measures and the working of the same. It is made clear that Sheffield has been associated with the manufacture of steel knives from the Roman times. Fairbanks plan of 1771 and Bucks view, taken from the high ground of the Manor, with the spire of the Cathedral dominating the centre, afford a fair idea of the aspect of Sheffield a hundred and fifty years since. A very different view is presented to-day. Plate VI shows the historical growth of the city from 1736 to 1921, which growth is described in the text. In 1840 the first railway connection with Sheffield was made, but it was not until 1850-60 that the railway system was fully developed, when a fresh departure of local industry followed. From that time to the present Sheffield, like most other English manufacturing centres, has been allowed to grow without regard to the housing needs of its workers. In the concluding paragraph of the historical chapter there is an interesting reference to " the ingrained aptitude of the population for technical work, requiring a high degree of skill—what might be termed its 'Mass Inheritances.'" As Professor Abercrombie is careful to explain certain factors have assisted the receiving and maintaining of a tradition, not always by a direct line of workers. From a study of the plates and photographs forming part of the historical survey, information is gathered that the intensity of the urban development in proximity to open country is in marked contrast. It will be obvious, therefore, as the Professor's proposals show, that the gradual transference of the working population to urban districts must form the basis of reorganisation.

Chapter III deals with the municipal boundary, and Chapter IV describes the natural zoning. There are traffic diagrams and accessibility maps, and plans showing the density of the population, which rises from 10,000 in 1725 to 520,000 at the present day.

The remainder of the historical section deals with existing housing conditions and suggestions for periods of reconstruction. Health conditions, open spaces and parkways are described. There is a plea for the extension of the Survey, which, exact as it is, is nevertheless one of those things

" Which always must be carry'd on
And still be doing, never done."

Part II of the monograph is the most illuminating of this excellent work. The main theory is the founding of zones or districts of different occupational character. " The problem, therefore, is not here to find out what to zone for, but how to arrange the separate parts of the city so that they form one satisfactory mechanism, each part performing its functions in the best way." The scheme has been followed up in the suggestions for development by studying the balance that should exist between the industrial and commercial interests of Sheffield and at the same time endeavouring to secure the best residential amenities for the people. As previously mentioned, the proximity of the heart of Sheffield to the surrounding country can be made subservient to the readjustment of housing values; but the transference of residential quarters to the outskirts of the city can only take place gradually. There is also the allocation of definite factory areas, where new works are projected, to be taken into consideration. In the plan for improving the roads, the scheme has been influenced by local conditions; thus all the roads shown on Map No. 2 have a distinct value. The improvements suggested at the heart of the city are few, but they touch upon the essentials of the case. Only one central improvement of magnitude is suggested, the proposal being the replanning of the central station on a high level; for the city requires such a terminal, and in this differs from places like London and Paris, both of which have a ring of terminals.

The monograph on Sheffield contains theories applicable to almost every town in the country, for it shows the absurdity of dealing with towns piecemeal, without regard to a comprehensive scheme. The enterprise of the municipal authorities will have one good result if it is productive of inquiry on the part of the authorities of other cities in the direction of town development and control. The monograph is produced with taste; the diagrams and maps, while highly technical, are easy to read, and summarise the expert knowledge of the director, as well as the industry and skill of those who collectively have contributed to the success of the work.

* A Civic Survey and Suggestions Towards a Development Plan. Report by Professor Patrick Abercrombie on the scheme prepared for the Development Committee in collaboration with R. H. Mattocks. (The University Press of Liverpool, Ltd.; Hodder & Stoughton, Ltd., London.) 1924. 20s. cloth; 15s. paper.

REIMS CATHEDRAL

SIR BANISTER FLETCHER, F.R.I.B.A., in a recent lecture, at the Central School of Arts and Crafts, showed that all the principles of Gothic architecture, at the period of its greatest perfection, were exemplified in the construction and decoration of Reims Cathedral, to which he solely devoted this lecture.

Great among the many great cathedrals which cover France, and third among them in actual size, the cathedral overlooked the town which took its name from the Remi who submitted to the Roman legions. The first church was probably of timber; the second church on the site was destroyed at the beginning of the thirteenth century, just when the time was ripe for building a cathedral in the free Gothic style which was so well suited to French freedom in ideas. Archbishop, architect, masons and citizens set to work to rebuild their old cathedral, which had already attained such a proud position as the coronation church of France; and the church they erected proved to be the greatest tirumph of Gothic art in France.

Piccadilly, New Premises.

We understand that Messrs. Higgs & Hill have secured the contract for the new building work at the premises of Messrs. Swan & Edgar, and that Sir Reginald Blomfield will be the architect.

GOOD AND BAD MANNERS IN ARCHITECTURE*

By PROFESSOR C. H. REILLY.

While we are all discussing Modernism and wondering how we can express our valuable selves in our new buildings without resorting to the cast-off garments which used so conveniently (as it is now said) to cover up the emptiness of our invention, Mr. Trystan Edwards comes along with a new working hypothesis which we can all accept. It may not be the ultimate revelation, but it seems to me very good as far as it goes, especially for those of us who build in cities. It is one of those very obvious things which, once it has been pointed out, makes us wonder that we have not all had it before our eyes from the very start. It is simply this, that, whether we are modernist or traditionalist, the town as a whole is more important than any of our single buildings. Our towns are indeed the most self-revealing products of our civilisation, because in spite of all the new town-planning Acts we still make our towns to a very large extent unconsciously. Each ant adds a little piece to the pile without realising the ultimate shape of the whole, or, indeed, what the vast majority of his neighbours are doing. The ant-heap conception of the town might be all very well for the nineteenth century, with its ideas of unlimited individualism and competition, but it would not have done for the aristocratic eighteenth century, and it certainly will not do for the democratic twentieth. Our modern towns, spoilt as they have been by our immediate predecessors, not to mention our own shortcomings, are nevertheless the property of us all, and we as architects are their chief guardians. Mr. Edwards' book is a direct call to us to understand our responsibilities in this respect. It is a call expressed with a great deal of quiet humour and incisive wit, which makes the lesson he has to teach very good reading, however unpalatable to our pride on quiet reflection. Unless we have some reasoned conception of the town as an entity and of the relative social values of its component buildings, we are not likely to design those buildings so that they form parts of a consistent whole. The resulting whole will not express our ideals, however truthfully it may mirror our achievements. Some things will be too blatant and vulgar, some too small and insignificant. If we have no settled conviction as to the basis of good architecture, at least let us cultivate good manners and build with a reasonable urbanity and consideration of our neighbours.

Good manners are of two kinds. The less valuable are the manners which are the result of habit. They can be taught by rule and precept. Perhaps the eighteenth century, with its good architectural manners, relied too much on rules dictated from above. That was infinitely better, of course, than the period of simple barbarism which followed. The better sort of good manners, however, are those that come from an inner harmony of spirit. Such are the manners most needed to-day, and only by acquiring them can democracy really flourish. Very few of us seem to realise this in our buildings. Acting for our immediate clients, we are apt to forget our responsibility to the whole community. Architects should feel themselves to be a priesthood standing between God and the people. It is their business to translate into material forms only such aspirations of their clients as are worthy. If a client demands a building which, from its size and shape, will destroy a whole neighbourhood, and if he cannot convince his client of his folly, he should resign the work.

The detailed working out of this theory of the placing of the rights of the community before those of the individual will be found in Mr. Edwards' book, with many amusing and striking illustrations. He analyses architectural features for their social import. He restores the Orders to their right function as developed historically from temple, palace and forum. He carries his researches into the suburbs and exposes the rudeness of the unsociable gable, and towards the end of his illuminating treatise pillories a good many of the unfortunate Ruskinian doctrines of last century, such as the Seven Lamps of Vulgarity. Obviously Mr. Edwards is maintaining his reputation as a vigorous and courageous writer. In these days, when everyone is looking round for some solid ground on which to build, it is a great advantage to us all to have an architect with a trained philosophical mind exploring the subsoil for us. It is one of the things we are most proud of at Liverpool that after his career at Oxford Mr. Edwards went through the Liverpool course and afterwards worked with Professor Abercrombie at Civic Design. Civic Design in its broadest sense might be said to be the keynote of his teaching.

* "Good and Bad Manners in Architecture." By A. Trystan Edwards. (Philip Allen & Co.) Price 6s.

TOWN-PLANNING

In his ninth Town-Planning lecture at Birmingham University, Mr. William Haywood, F.R.I.B.A., said the Town Planning Act of 1909 marked an important date in town development. Government approval was then secured for a policy of progress, subject to a preconceived plan, and embodying certain new principles of house design and site arrangement, the excellence of which had been advocated and tested by reformers during the preceding twenty years.

Prior to 1909 town-planning conditions in all countries were represented by the development of characteristic local tendencies, and had not the comprehensive form that they had to-day. Since 1909 these tendencies had matured, and had been augmented by the interchange of international experiences making for progress on broader lines. For example, the feeling for corporate expression which was so marked a feature of Continental life, and out of which arose the very conception of town planning, had been supplemented abroad by the adoption of the best fruits of English individualism. The individual home, the limitation of houses to the acre, and the economic design of exclusively residential roads, were now universally accepted, as preferable in most cases to tenement buildings and roads for all purposes. In a similar manner, American schemes for municipal recreation, and her experiences with zoning, were valuable aids to wider views elsewhere. Town planning, in the modern sense of the word, was of comparatively recent growth, yet actual work upon town problems already showed that in some respects it was closely related to wider regional needs, as these in their turn were related to the still greater problem of national organisation.

In one respect the Town-Planning Act of 1909 was deficient. Although largely inspired by a desire for greater amenity, the promoters of the Act failed to provide any adequate method for giving legal assistance to this end. Public opinion, however, was moving towards an appreciation of beauty in future work, and in this new interest they should find scope for giving to their towns an uplift in outward expression which so many of them lacked.

ARCHITECTS' BENEVOLENT SOCIETY

Architects who have not yet insured through the Architects' Benevolent Society will, it is hoped, do so at an early date, either by effecting new policies, or, in the case of policies already placed, by transferring them to the agency of the Benevolent Society. The Society is in touch with most of the leading insurance companies, and is in a position, with the help of an advisory committee of insurance experts, to offer advice on all insurance matters, the interest of the insured receiving special consideration in every instance. In life assurance, the Society allows a rebate of half of the commission. The other half of the comm as is the whole of the commission on p other than life, is retained by the Societ credited to the fund in the published donors and subscribers as a contribution the architect who has insured.

Since the insurance scheme first starte sum of £100,000 has passed through the a of the Society, which has received in comm close on £300. In addition, nearly £200 ha returned in rebate.

These figures, though encouraging, ar it is considered, proportionate to the num architects now practising in this country. Architects' Benevolent Society urgently money; and while appreciating the exte which architects in the ordinary way su it with subscriptions and donations, the S does, at the same time, appeal to them for support in the effort it is now making th its insurance scheme to help itself. A £ life assurance brings in £10 (half of whi returned as rebate) the first year, and £1 15 in subsequent years; a motor car polic £500 brings in two guineas; and a £1,00 policy effected through the agency of Society brings in the small amount of 2s. so that, obviously, before any real bene felt to the Fund, it will be necessary for a large number of people to give their insura

Particulars of any kind of policy will be by return of post on application to the Secre of the Benevolent Society, 9, Conduit-stree

EXHIBITION NOTES

Amongst the current exhibitions there two or three of a decorative kind which appeal to our readers. At the Beaux Gallery, in Bruton-place, is a fine collectio modern pottery by Mr. Reginald Wells, w shows with what admirable feeling he grasped the essential qualities of Chi pottery. The colour, form and glaze are indicative of the sympathetic study the a has bestowed on Chinese art, and though t is little or no divergence from the oriental we feel that the designs are not the resul mere copyism, but show a keen sense of possibilities which are open to those who sympathetically follow old traditions. M of these pots have a delightful simplicity breadth with a refinement of form and co which give them in many instances a decorative value; in both delicate tone colour as well as in quite rich examples effect is nearly always pleasing and refined. Mr. Wells is gifted with a real sculptural inst the modelled animals and figures will appe those who desire something better tha merely clever naturalistic treatment. Som his little horses and cattle have quite an ar tectural value.

There is also a good collection of distinc pottery shown in the Greves Gallery, so tha may gather from these and other recent e bitions that we are witnessing a renaissanc design in the best kind of pottery. The p cipal feature of the Greves Gallery is a va collection of Mr. A. J. Rowley's brilliant w inlay. There is a wide field open to beau work of this kind, not so much, we think wonderful renderings of pictorial subjects in real decorative work as applied to furni and buildings. Attractive and clever as is m of Mr. Rowley's work, it is only right to p out that much of the work still leaves someth to be desired in the matter of form outlin the tree shapes are often lacking in really satisfactory suggestion of tree grow whilst sometimes the wood grain is rathe disturbing element instead of a help. Brangwyn's panels have a strong decora value, but for real achievement in tone colour it would not be easy to surpass Rowley's own work in "Westmorland" (which anyone might be glad to possess. such things as "The Sower" and "St. Chri pher," by Mr. A. Chase, we find a keen s of the value to be obtained by these w inlays.

RCHITECTS' & BUILDERS' INQUIRY BUREAU

'e are glad to give questions and answers, but cannot pt responsibility for contributed replies, especially on l matters.

Tay we appeal to our correspondents to submit their ies on paper of a size easily filed, and written as ly as possible, or better still, in typescript.—ED.

Aberdeen Granite.

EPLY TO "ENGLISHMAN," NOVEMBER 28.]

IR,—The following are the chief varieties Aberdeen and Peterhead granites:—Rubis-—Dark greyish blue in colour, and with grain. This variety is much in demand monumental work, and is, I believe, used in balustrade of Waterloo bridge. Dancing rns—Light bluish grey in colour to a darker v. This is, I believe, the granite used on Thames Embankment, and is also used as nite setts. Kemnay—Light grey with dark ticles of mica.

"ANOTHER ENGLISHMAN."

IR,—*Re* Scotch granites, the following ticulars may be of use:—County of Aber-ishire—Red granites quarried in Peter-d, Huntley, Cruden, Buxburn, Aberdeen. y granites quarried in Buxburn, Newhills, tore, Cluny. The true granites from rdeen and Peterhead are especially noted their durability and beauty.

"F. C. D."

Stone Flags.

REPLY TO "GARDENER," NOVEMBER 28.]

R,—Stone paving should be laid on a good of sand well levelled and packed up to orm with the different thicknesses of the , the corners of which should only be led up in lime mortar, and the joints made he mortar, and finally grouted up. This nod is much less likely to result in cracked , as the sand will accommodate itself to underside irregularities and provide con-ous support without subsequent shrinkage h may occur where the stones are bedded continuous bed of mortar.

"PAVIOUR."

Thatching.

[REPLY TO DEVON, NOVEMBER 28.]

R,—I noticed in the letter on "Thatching," ed by "Devon," that the water from a ched roof is not worth retaining. Does this n that the quality of the water is not satis-ory, or that the amount is very small on unt of it soaking into the thatch? I am ng a roof thatched with Norfolk reeds, and ld be glad to know whether "Devon's" rks apply to this kind of thatching. The s in this job will project 24 in.

F. C. P.

A Damp Party-wall.

[REPLY TO "BUILDER," NOVEMBER 28.]

R,—It is unfortunate the points of the com-are not given; also the thickness of the y-wall between C and B. According to the h plan, there are two dimensions given for same width, but they do not agree by 4 in. ıs call them the north and south dimensions. north dimension reads 24 ft. 7 in.; the h, 24 ft. 3 in.; thus the north dimension is longer than the south, although they are figured to the centre of the party-wall. thickness of the party-wall not being given, rather difficult to get an idea of the situation. flank wall to the basement addition may not ıe same thickness as the party-wall between d C. If this is the case there may be a set-of 4½ in. to the said flank wall, and the pipe in question would be on C's ground, ıe would be the owner of the pipe, and would to make good all damage done to his wall. ıy case, C would be entitled to fix his R.W. on his wall, to the extent of his boundary, which would be the outside edge of the footings, although they are not seen.

There appears to be an easement for rain-water from the roof of B's house to the R.W. pipes on the flank walls of A and C's houses.

If the dimensions are correct, someone has erred in setting back the iron fence 2 ft. or more on C's ground; but as the new owner of B's house bought it as it stands, this is a matter of settlement.

A. SOUTH.

Thickness of Lead.

[REPLY TO "YOUNG ARCHITECT," DECEMBER 5.]

SIR,—The thicknesses of the weights desired are .069, .085 and .102 in., respectively. To measure, cut a portion of, say, the 4 lbs. weight 6 in. square. If it is "according to Cocker," its weight will be 1 lb.

JOHN M. FIFE.

SIR,—Four lbs. lead is .068 in. thick; 5 lbs. .085, and 6 lbs. .101. The best and handiest method of measuring is by means of a lead gauge, obtainable from any firm of instrument makers. This gauge takes the form of a brass or gun-metal plate cut with V incisions, the inner edges of which are graduated in lbs. The sheet is inserted into the V, which tells the weight per ft. super.

"FATHER."

Wall Paper.

[REPLY TO "AMATEUR," DECEMBER 5.]

SIR,—The first dimensions are those of British-made goods. The second, 9 (not 8) yds. long and 18 in. wide, are of French manufacture.

JOHN M. FIFE.

SIR,—The paper supplied to Amateur was probably of American manufacture, as 8 yds. by 18 in. is the standard American size. The size which your correspondent anticipated is the standard English size, though there are some English firms who now, I believe, make their papers only 18 in. wide.

"ENGLISHMAN."

"Hot Plates."

[REPLY TO "BAFFLED," DECEMBER 5.]

SIR,—Most makers of gas cookers sell a hot closet in conjunction with a hood, that collects and disposes of the hot air from the oven and gas rings, by way of a flue pipe. This arrangement has generally proved satisfactory. Any good firm of makers of which names will be found in the advertisement columns of *The Builder*, would be glad to give full particulars.

"DISINTERESTED."

Decay in Stone.

[REPLY TO "CONSTANT READER," DECEMBER 5.]

SIR,—Brush down and apply two coats petrifying liquid, allowing a few days to elapse between each application to admit of the first coat's penetration.

JOHN M. FIFE.

SIR,—Your correspondent will find most of the information he requires if he applies to the Department of Scientific and Industrial Research 16, Old Queen-street, Westminster, which department places the results of the useful research work carried out under its auspices at the disposal of architects and others interested.

"LONDONER."

Hollow Walls.

[REPLY TO L. C. M., DECEMBER 5.]

SIR,—I am very glad to read your correspondent's letter calling attention to the lack of soundness in the construction of cavity walls in the generally accepted methods. There is no doubt that the life of such work is strictly limited, and that there should be a good market for earthenware ties manufactured in such bulk as to make their use a commercial proposition. It only needs the courage of repeated and insistent demand for such goods to ensure the supply, and we should then have the satisfaction of knowing that we are building to last. The price need not be compared tie for tie with the galvanised variety, as every earthenware tie would save one brick, the saving of which must be reckoned.

"SOUND BUILDING."

Cheap Roof Trusses.

SIR,—I should be glad if any of your correspondents could advise me of an economical and sound timber roof truss suitable for a building 20 ft. span with a battened and slated roof of 30 deg. pitch. The old forms of King post trusses seem very wasteful of material, and unnecessarily strong for the purpose, while their form does not seem to allow of the sizes being materially reduced if their own weight is to be carried.

PROGRESS.

Cement Flashings.

SIR,—Now that sound waterproofing materials to be used in conjunction with cement are on the market, can you advise me as to whether the use of cement so treated for flashings can be considered as a sound method of construction? In an age when economy is of such vital concern to building, such matters, I think, merit consideration.

"SAXPENCE."

Made Ground.

[REPLY TO "PRACTICE," DECEMBER 5.]

SIR,—I quite agree with all that is stated by "Practice" in his reply of December 5, to my letter of November 14, especially as regards the weight of the superincumbent building being first obtained, and then the bearing capacity of the soil to be built upon. If this is not good, precautions must be taken to distribute the load by concrete foundations, rafts, or piling, as the case may be. I did not deal with this important part of the subject in my short letter.

A. SOUTH.

Speculative Building.

SIR,—I shall be glad if some of your readers will kindly state the price per foot cube they are able to erect terrace-type houses of three bedrooms, 18 ft. frontage.

Owing to the fluctuation in wages and materials, it is difficult to obtain accurate data.

"BUILDER."

Building By-laws.

[REPLY TO "A.G.L.," DECEMBER 5.]

SIR,—A structure may be a new building under the Public Health Act, 1875, and, at the same time, a temporary building under the Public Health Act, 1907. See Andrews *v.* Wirrall R.D.C. (1916), 1 K.B. 863.

Section 27 of the Public Health Act, 1907, deals particularly with the erection of temporary buildings. This Act, however, only becomes operative in a district on the Order of the Ministry of Health; but it has become operative in very many urban districts and some rural districts.

In these cases, the question to be determined is, whether the structure can be a "building" or not; whether it is of a mere temporary character or not. A portable theatre, constructed of wood and erected for a short period only, was held not to be a "building" under the section above referred to. See Newell *v.* Ormskirk U.D.C. (1907), 71 J.P. 119.

So, too, in Whitehorn *v.* Smelt (1910), 74 J.P. 102, a "houp-la" with a canvas roof, and closed in on three sides with canvas, was held not to be a "building." And in general it was said in Southend-on-Sea Corporation *v.* Archer (1901), 70 L.J., K.B. 328, that structures erected

for temporary purposes, not having the character of buildings used or intended to be used for purposes of human habitation, are not "new buildings." But the fact that structures are not intended for human habitation does not of itself take them out of the category of new buildings; for, in South Shields Corporation *v.* Wilson (1901), 65 J.P. 294, a wooden shed intended for use as a stable only, was held to be "new building" within a by-law.

In Stevens *v.* Gourley (1859), 7 C.B. (N.S.) 99, a structure of wood intended as a shop, and laid on timber, and not let into the ground, was held to be a "building"; and, again, in Richardson *v.* Brown (1885), 49 J.P. 661, a wooden building, 30 ft. × 13 ft., *on wheels*, used as a butcher's shop, and having a supply of gas, spouts, and a fall pipe, was also held to be a building.

On a consideration of the above, it would appear that the structure described by "A.G.L." is a "temporary building," and subject to the by-laws of the locality. The fact that it can be taken down and erected elsewhere, and on wheels, does not affect his position. It may be added that, in recent years, many concessions have been made by local authorities in respect to temporary and wooden structures. "A.G.L." should ascertain what these are from the local authority concerned, for they may assist him in his difficulty. "L. J. C."

THE WEEK IN PARLIAMENT

WESTMINSTER, *Wednesday.*

THE King opened Parliament in person, on Tuesday, December 9. The gracious speech from the Throne contained a number of references to housing, as is shown by the following extracts:

"My Ministers are deeply impressed by the continued shortage of housing accommodation. They are convinced that the encouragement of the private builder and the occupying owner is an essential element in the successful treatment of the problem, and substantial progress has been made in this direction. My Ministers will devote their attention to overcoming the rising cost of houses and the shortage in the available supplies of skilled labour. With this object, they will endeavour to supplement the building resources of the country by encouraging new methods of construction calculated to promote the rapid production of houses of approved design and moderate cost, and, at the same time, to assist in the reduction of unemployment.

"The housing problem is not merely one of overcrowding, but also of the existence of large numbers of houses which fall below modern standards of propriety and sanitation. Something is already being done under existing legislation to clear the worst areas and to remedy sanitary and structural defects in those which remain. As new building increases, it will be possible largely to develop this process, and my Government will take every opportunity of pressing it forward with vigour."

His Majesty added that measures would be presented for the consolidation of the Law of Property and of the enactments relating to the procedure of the Supreme Court, for the reform of the system of rating and valuation in England and Wales, and of rating in Scotland, and for the prolongation of the Rent Restrictions Act.

Mr. R. G. Ellis, the mover of the motion for the presentation of an address of thanks, in reply to the Speech, said that housing, so far, had been very much the sport of politics. The slow progress had been the subject of two schools of criticism, that which alleged that there had been profiteering in materials, and the other contending that "ca' canny" and restriction of output had raised the cost. If any private interest, springing either from the owners and producers of materials or from trade unionists, determined to hold up things for their own ends, or continued to obstruct in the way that had been suggested, the House would demand and the Government would be obliged to grant some form of legislation putting an end to that sort of exploitation.

THE AUCTIONEERS' INSTITUTE

MR. E. H. BLAKE, C.B.E. (Secretary) recently read a paper before the Auctioneers' and Estate Agents' Institute on "The Institute, 1886–1924." In the course of his remarks he said for the first three or four years of its existence the Institute had its home at No. 50, Moorgate-street, as it then was. In 1890 larger premises were taken at Nos. 57 and 58, Chancery-lane, and these served their purpose for nearly 16 years, although by 1898 there was a demand for increased accommodation. Suitable premises were looked for in all directions, but it was not until the end of 1905 that it was decided to acquire a lease of No. 34, Russell-square. Extensive structural alterations were made, and the Institute entered into occupation in the spring of 1906, remaining there for about 18½ years. There was no doubt that the members of the Council of 1905 thought those premises would serve the purposes of the Institute for a generation or two; its growth had evidently exceeded their most sanguine expectations. At the Birmingham Provincial Meeting in September, 1921, Mr. Chas. Osenton submitted the proposition that the Institute had reached a stage in its development when larger and more commodious premises had become an absolute necessity for the proper carrying on of its work.

Only three short years ago—but a good example of the promptitude with which their Council acted. Who, hearing Mr. Osenton's proposal at Birmingham in the autumn of 1921, would have thought that by the autumn of 1924 the Council would have found this fine freehold site, obtained possession from the numerous tenants, demolished the old buildings, erected and equipped the new building, and have been in the position of holding this, the first of their winter meetings of 1924–5 in the new premises?

The first effort of auctioneers to combine for their mutual benefit would appear to be indicated by a memorandum which was drawn up at the Piazza Coffee House in 1799. That memorandum resulted, he understood, in the formation of the Society of Auctioneers, a Society which was still in existence. The membership of the Society was limited, and its functions were, he believed, restricted to those of a dining club, at the dinners of which matters of professional interest were discussed. It was in 1886, eighty-seven years later, that a Mr. Ottley circularised the members of the profession in regard to the formation of an Institute of Auctioneers. A meeting was held at the Cannon-street Hotel, 120 members of the profession being present. It was decided to proceed. The first annual meeting was held on March 23, 1887, when it was resolved to take steps to secure incorporation under the Companies Acts. Matters moved slowly in those days, and although this Institute of Auctioneers and Surveyors of the United Kingdom published its first prospectus in the Press in April, 1887, it was not until two years later that really active steps were taken towards incorporation. On June 26, 1889, however, the organisation was duly incorporated as "The Auctioneers' Institute of the United Kingdom," and it continued its progress under that name until March 6, 1912, when, on the Estate Agents' Institute being amalgamated with it, it became the Auctioneers' and Estate Agents' Institute of the United Kingdom.

Northampton Polytechnic Institute.

On December 5, the annual prize distribution of the Northampton Polytechnic Institute took place at St. John-street, E.C. Mr. L. B. Sebastian (Chairman of the Governing Body), presided. The Marchioness of Northampton distributed the prizes, and an address was given by the Marquess of Northampton, D.S.O.

Among the degrees and certificates awarded by the University of London to students attending the day and evening courses in engineering, no less than twenty-nine students obtained the degree of B.Sc. (Eng.), of whom three obtained first class honours and seven second-class honours.

THE SURVEYORS' INSTITUTION

MR. E. P. WELLER recently read a pa "Agricultural Costing: An Aid to Management," at the Surveyors' Insti In the course of his remarks he said the ment of a farm might be divided into two g (*a*) those things which were usually own the landlord (buildings, fences, hedges, d drains, roads, &c.), and (*b*) those which usually the property of the tenant (w horses, milking and breeding stock, mech implements, tools, utensils, &c.).

With regard to the landlord's equipmen problem in the case of a tenant-f involved comparison of the value of the ment for production and the rent asked plus the tenant's share of the cost of mainte and incidental expenses such as rates and It had been said that buildings were unpr tive, but adequate and well-designed bui might so assist economical working of the particularly in regard to labour costs, that materially improved the financial results. farm so equipped was therefore worth an rent as compared with one which was not s provided. Similar considerations applie other kinds of equipment. Some might the effect of directly reducing outlay, others might enable a given outlay to pro larger returns. At the same time, the presence upon the land of buildings or equipment, even if of up-to-date design costly construction, was no reason at all the tenant should agree to pay rent for t He had to consider value for production and appearance or cost.

In the case of an owner-occupier similar siderations applied but sinking fund and int on purchase money or on cost of constru must be substituted for rent, and the full of maintenance, rates and taxes must be ad It might also be necessary to take into acc the value of the farm and equipment to owner for production compared with the it would realise if sold, due regard being ha alternative investments for the capital.

The question of the tenant's equipment bound up with the system and methods of duction adopted and the labour organisatio the farm. With regard to live equipment, farmer had to decide what classes of stock would keep and in what proportion. He n further consider the relative advantages disadvantages for specific purposes of diffe breeds and of pedigree stock *versus* ordi commercial stock. The considerations affec dead stock were similar to those applying buildings, &c., purchased or constructed by farmer. He must estimate the economy working which they would effect, or the proved results they would give, *i.e.*, their v for production compared with interest upon outlay involved, plus sinking fund and upk

A wrong decision upon any of these po caused waste. Costing was of the utmost v in assisting correct decision.

An Architects' and Builders' Diary.

The 1925 edition of *The Builder* Diary, wh has been so well received and appreciate former years, is now available (London: Catherine-street, Aldwych, W.C.2, price 2s. net). As in previous years, the first contains a great deal of valuable informatio everyday use to those engaged in the ar tectural and surveying professions and building industry. Full notes are given on the building trades, and there are mensura notes, notes on buildings and fire insura full particulars of the organisations in professions and trade, a list of scholarsl and prizes in the professions, postal informat &c. Pages are reserved for memora followed by calendars for 1924, 1925 and 1 The remainder of the book is occupied wit diary for 1925 (one opening to a week), space for a cash account. Altogether there about 180 pp. in the book, which is printed thin paper so that it is only three-eighths of inch thick; the book measures 6 in. by 4 a convenient size for the pocket.

THE BUILDING TRADE

THE TRADES' TRAINING SCHOOLS

annual prize-giving of the Trades' Schools, conducted by the following ilds—The Armourers and Brasiers, ers, Glaziers, Joiners, Paint-Stainers, rs, Plaisterers, Tylers and Bricklayers heelwrights, Great Titchfield-street, d at Carpenters' Hall on December 5, over by Mr. James Harris Browne, of the Carpenters' Company.

Frederick Sutton, J.P., chairman of ools Committee, read the annual report ted that the attendances during the reached 12,612, giving an average of At the Building Exhibition at Olympia Building Craft Schools took part, and ry successful in the competitions.

anister Fletcher, F.R.I.B.A., Director Schools. gave the thirty-first report of rk carried on during the session, and said the session's work was ad- d on May 8 by the judges, who t well up to the usual standard and ally above it. The judges were: Frederick Sutton, J.P. (Past Master Carpenters' Company, and Chairman of ools), G. C. Barnes (of the Joiners' y), J. Harris Browne (Master of penters' Company), E. Guy Dawber, esident, R.I.B.A., W. J. Englefield Pewterers' Company), W. R. Evans Master of the Carpenters' Company), orge Frampton, R.A., J. A. Gotch, .A.. F. T. W Goldsmith, F.R.I.B.A. Master of the Plaisterers' Company), wart Greene (of the Painters' Com- W. Grellier, F.R.I.B.A. (Past Master Tylers' and Bricklayers' Company), . Goscombe John, R.A., Bertrand (of the Pewterers' Company), E. Lancaster (of the Joiners' Company), Marsland (of the Tylers' and Brick- Company), W. J. Minn (Past Master Carpenters' Company), George Parlby, Plume (Editor of *The Builder*), Percy (Past Master of the Carpenters' y), E. S. Rider (of the Joiners' Com- Frank W. Robson (Past Master of heelwrights' Company), S. G. Castle , M.I.E.E., H. D. Searles-Wood, B.A., H. P. Shepherd (of the Wheel- ' Company), Sir Brumwell Thomas, B.A., A. R. Upjohn (of the Glaziers' ny), and Mr. J. Hutton Freeman, o the Carpenters' Company.

following trades and crafts met during sion. under the tuition of the under- —The Carpenters, under Mr. Henry S. ead, assisted by Mr. Archbold; the . under Mr. Charles E. Dunkin and puty, Mr. Smart, assisted by Mr. the Masons, under Mr. H. G. Bush; aziers. under Mr. J. Dudley Forsyth. l by Mr. Dankes; the Painters, under J. Fowler; the Plaisterers, under Mr. Pearson; the Plumbers, under Mr. g, assisted by Mr. Pardoe; the Metal rs' Class, under Messrs. H. Collins N. Coldwell; the Stone Carvers, under akley; the Life Modelling Class, under harles L. Hartwell; the Tylers' and yers' Clase, under Mr. F. W. Billing- the Wheelwrights, under Mr. R. C. ; the Wood Carvers, under Mr. F. A. am: the Electricians, under Mr. S. as, assisted by Messrs. Kemp and

ourse of demonstrations in various crafts again given by their instructors to ts of architecture from University Col- to impart that practical knowledge of rafts which is so important to the ect in practice.

Banister said the students' enthusiasm not in the least abated, and a steady n of apprentices and improvers poured y into their school in Central London from the most diverse quarters. All the widely scattered districts contributed their quota to the training ground in the crafts of building, which were in their entirety such essentially national industries. He would like to emphasise their peculiarly national character, for without any artificial or legislative interference, the building trade was, of its very nature, a protected industry, free from foreign competition, because it had to be carried out where it was actually required for use. This might not apply with equal truth to each individual contributory branch of the work, which went to the making of a building, especially in these days of modern methods. In England, in the variety of products required, they were face to face with the threatening danger to British building which their schools set themselves to combat by producing good craftsmen.

They could not import—at any rate at present—whole new buildings from overseas; they must be erected here. They could import raw materials, and their aim should be so to equip their own workmen that they could turn this raw material to the best possible use. This was the object of their schools—to equip their own men so that they could turn out the best work to the best advantage in all the interdependent crafts. They were all familiar with the saying that "Necessity is the mother of invention." They did not sufficiently realise, however, that if, from any cause, at any time, there was a shortage of any one particular material necessary for building, then that was the opportunity for the inventor to step in and supply a "substitute." Had not the war taught them that there was a substitute for everything except a good workman. It was their business in these schools to produce the good workmen, ready and willing to do the work required of them. From a variety of causes, there was now not only a shortage of bricks but also of bricklayers for building the houses for which the people were clamouring. Side by side with this there were, they were told, millions of bricks which only had to be shipped over from Belgium or even from Germany. They had often heard that you could not make bricks without straw, but there was now no difficulty in making houses without bricks, so there was a rush to supply all sorts of substitutes, and soon they might have the "all-steel house" of Lord Weir. This sort of production was something hitherto outside the building crafts, and was one of the results of the new desire for that mass-production which was both cheap and quick, and which was so largely independent of individual effort. It was to train the individual workmen that their schools existed; first of all to awaken and strengthen his capacity to learn, and then to develop his capability to work. They were not concerned with the political aspect of their industries, nor with trade union activities; but they were deeply concerned to develop the individual, both as to his outlook and to his work, so that he should be not only willing but able to give of his best for the best pay he could get. It had lately been said by a labour leader that "there are no employers who fail to understand that they had no right to demand the best from an employee, unless they were prepared to give the best in their turn." That was a warning which all engaged in any craft would do well to lay to heart. This was the spirit which they sought to engender in their schools. They sought to spread the propaganda of efficiency, and to cultivate a living loyalty to old British traditions of superiority in workmanship, so that British craftsmanship, by its reputation for thoroughness, might continue to challenge the world. In conclusion, there was no real pleasure quite like that which arose from unstinted expenditure of energy in a helpful environment and the application of one's powers to some objective worthy of them. Let them hope, therefore, that a life of active service, and of the enjoyment resulting from it, laid before every one of their students, so that in the days to come, each student might feel that he owed much to those who guided his mind and his hand in the training of his early days at the Trades' Training Schools.

Sir Kynaston Studd, O.B.E., then distributed the prizes, and said he had great pleasure in being with them for various reasons. He had intense respect for all the City Companies were doing in maintaining educational institutions, and he was particularly attracted to their school because it had for its object the training of those trades round which the Companies who maintained the schools were founded. He had also had a certain amount of experience of the value of technical schools at Titchfield-street where he was their nearest neighbour. There had been remarkable successes attained almost entirely due to training received in spare time. There was nothing more encouraging than to visit such an institution and see the type of man who, after a day's work, found time to equip himself so as to enable him to do something worthy both of himself and his country. They had had splendid successes in carpentering, metal work, and bricklaying, and had the advantage of studying with other young men of similar age and intelligence. Last week he had revisited their school, and had been delighted to find that no special preparation had been made. Nearly all the things they were doing had been done in The Polytechnic (Regent-street) in days gone by; they were acquiring knowledge and would use it in the manner most remunerative. Useful work enabled them to help, not only themselves, but people outside. He was much impressed with Sir Banister Fletcher's remarks about the teachers. There were two things needed in a teacher apart from knowledge: faith and inspiration. This ideal their teachers had attained. He would impress upon them that skill and intelligence in their own trades represented their capital. The more skill the greater the capital, and the greater the returns from that capital. There was much unemployment, and, he was afraid, many unemployables. They had had no education to enable them to command a living wage. If the students learnt their trade thoroughly they would never need to have any anxiety as to where to obtain work in order to enable them to obtain a living wage. He appealed to them not to be satisfied with merely learning a trade and studying things belonging to that trade, but to go in for general culture, including, particularly, constitutional history. Also to cultivate a taste for good books. On the other hand, they must not forget the athletic side. They must also study human nature: to be skilled craftsmen alone was not enough. Let them consider their present relationship with their masters. Did they consider him a decent fellow or a "washout"? If they had a good master let them hang on and give him more than value for money. If they had the other kind it would be wise not to worry too much but to do their best to give him more than value for money: by example they might bring him to a more reasonable frame of mind. In conclusion, he would remind them that the main thing to remember in life was to have a sound mind, body and soul. They could do nothing better than to remember the words, "I am the captain of my soul; the master of my fate." He commended the sentence of one of their teachers as a motto, "Erect square and fix securely."

Cordial votes of thanks were passed to Sir Kynaston Studd, the Companies, the Chairman, and others.

CONCRETE AND CEMENT AS DECORATIVE MATERIALS

MR. T. P. BENNETT, F.R.I.B.A., lectured recently before the Institute of British Decorators on this subject. In the course of his remarks, the lecturer said: with the rapid development of steel as a constructional material and the parallel development of reinforced concrete, architects and designers were faced with the necessity of studying surface treatment which could be used for the design of buildings which arise directly out of the constructional materials employed, and particularly out of cement. The rapidity with which these constructional materials had developed was something which was new in building construction, and the constructional revolution which had taken place was perhaps as yet only imperfectly realised by those who were faced with the responsibility of using it.

For some thousands of years brickwork and masonry had been the principal materials employed in the erection of buildings, and in the last century, when steel and iron first became prominent, they were regarded merely as supporting materials and were faced with stone or brick, producing what one might call pseudo brick or masonry buildings. The objections to this system of facing one constructional material with another constructional material were rapidly becoming evident, and the most active brains in design could not help seeing that the day was not far distant when steel and concrete building must evolve its own method of expression. This was being rendered increasingly important because they were realising that the use of steel and concrete did not merely alter the external appearance of the building, but it altered the fundamental proportions upon which the design must be based. Design was, of course, much more a matter of proportion than of surface decoration, and it was therefore impossible to employ steel economically and cover it with a masonry skin with any real chance of a successful result.

In examining the history of the subject, they found that concrete was used externally by Roman and Byzantine buildings, and that they evolved methods of decoration of their own which might be made a basis to their study of the subject. In Roman work, concrete was not reinforced with metal, and the proportions of the parts of their buildings therefore approximated to the proportions of masonry structures. Furthermore, the social conditions of the Romans demanded the use of excessive areas of concrete in order that they might safeguard themselves against possible failures from the employment of unskilled slave labour. As a result, piers were of massive proportions, vaults were sufficiently thick to eliminate thrust, and other parts of the structures were adjusted to give considerable effect from deep reveals and projections. From these social conditions sprang also the principle of Roman decoration, that was to say the Romans were able to command an unlimited supply of men, the majority of whom had little or no skill, but they were able also to command a supply of other men of highly developed skill. Thus it would readily be seen that the most economical method of producing buildings was to build the carcase and case it with ornament. In the Roman baths, in the Roman palaces, in the great Fori, they got, therefore, mass concrete as a base and plaster mosaic or marble sheeting as a finish. It seemed logical to accept those broad systems of the Romans as possible sources of inspiration for their own buildings, because, although they had not experienced similar social conditions, the scarcity of skilled craftsmen and the steady increase in the number of unemployed unskilled men tended to bring about a set of conditions which were not dissimilar.

With regard to modern treatments, the lecturer said they came upon some of the essays which had been made on the Continent to use concrete with stucco or other finish for industrial and other buildings, and they were introduced for the first time to that vital revision of proportion which he had indicated at the outset as an essential part of design of the future. It was idle to express a mere arbitrary opinion as to their likes or dislikes for these preliminary essays in the logical expression of a new building material. This material he called new, because it was new in the form in which they were using it; that was to say, they did not command either the unlimited labour supplies or the unlimited money which was typical of the Roman and Byzantine use of concrete. They were, further, employing steel in a way hitherto unknown, which reduced the mass of their structures to relatively minute areas.

It was not surprising that the architects of the world had failed to find immediately a perfectly logical, sound, satisfactory, and interesting solution of this problem. Investigation into the history of construction showed that it was the first time for 2,500 years that the proportions of building had been fundamentally altered. He found, therefore, considerable fascination in the essays of M. Eric Mendellsohn, the German architect, who had endeavoured to produce buildings which arose completely from structural necessities and which were to be executed in concrete. The first of these was an optical factory; the next an aerodrome; while Bruno Tant's was another scheme for an office building and cinema. There was a certain atmosphere of amusement about these essays. To their unaccustomed eyes, they hardly looked like sane structures, possibly they were not sane structures, and possibly they would have a relatively small influence upon future developments, but they showed a real attempt to grapple with the proportion problem and to give reinforced concrete some new and logical expression.

With regard to the possible methods of surface treatment the lecturer said the first of these was the possibility of colouring grey Portland cement used in blocks or used as a fixing material. The first difficulty they had to face was a tendency of the acid in the cement to destroy the colour in the material, and the second the tendency of the colouring material to destroy the setting powers of the concrete. He had arrived at a rough distinction in colouring materials which he believed to hold good universally, but which he had not yet completely tested. This distinction indicated that pure metallic colours were perfectly safe, both as regards permanence of colour and the absence of deleterious effect to the setting of the concrete. Lakes which were mainly aniline dyes superimposed on colloidal clay retarded and might even completely destroy the setting powers of the concrete with, of course, disastrous results to the block or the stucco. Earth colours had a similar effect. At the moment he was using a purple oxide of iron in concrete blocks, which appeared to be producing a very interesting warm red purple.

Mr. R. R. Butler, chemist, of the Northern Polytechnic, had, said the lecturer, commenced to build up some definite information on this matter, and although his investigations were in their infancy he was able to give a few details. He had experimented with certain dyes in an effort to mix cheap water dyes with the water and so colour the whole of the cement at a more or less nominal cost. They were continuing these investigations so far as the possibility of mixing ground colour with concrete was concerned, and the following list indicated that safe colours were difficult to obtain and that the colour range was at present very restricted. They hoped to be able to add to this list in the near future: Safe colours—Red oxide of iron, purple oxide of iron, chrome yellow (lead chromate), vermillion. Unsafe colours—Derbyshire ochre, American ochre, Italian sienna, American sienna, Turkey umber, Devonshire umber. Umbers and siennas in general were unsafe because they contained clayey matter. Ultramarine contained clayey matter, and Prussian blue would turn brown because of the presence of lime; it would not stand up to alkalis. Brunswick green was Prussian blue mixed with chrome yellow, and was therefore unsafe and would lose its colour. Lakes were colouring matter, and were mixed wit matter; they were, therefore, unsafe.

The next point which was of interest employment of the white cement. cement was valuable for two reasons provided an extremely attractive su itself; (2) it could be made the basis tive colouring contrasts. White cem been employed in a number of buil America and was finding its way to Its first possibility was as a pointing its second as a stucco. Scrubbed with marble chipping or with stone some extremely interesting effects. enquired into the possibility of using work upon original structural concr had found that considerable difficul experienced in striking the forms and the scrubbed face at the exact period process of setting which left the sufficiently hard for structural purpos was still sufficiently soft to enable scrubbed. So definite was this difficu the attempt to execute scrubbed structural concrete had been abandon it was usually employed upon a stucco subsequently added to the main st He had, however, succeeded in scrubb face of concrete blocks which were cas being put into the building. Attem also been made to obtain these surface by treating the concrete with muriat which attacked the cement and left the a untouched. Such a method might ha great value if one could be certain action of the acid could be permanently at the desired moment.

Everyone was familiar with the buildings at Wembley; although these ings might be of architectural merit the effect was unattractive and heavy bec the almost complete absence of colo defect being emphasised by the ind texture of the material. This lack of att ness was particularly to be regretted in some cases extremely interesting wo been done.

NEW BUILDINGS

Uxbridge.—It is proposed to exte works of Messrs. King & Hutchings, printers, in Vine-street, Uxbridge. building of one story, extensively lighted lights and side windows, is to be erecte site 40 ft. by 90 ft., to be used for book and warehousing. The architect is Mr. Eves, of 54, High-street, Uxbridge.

Liverpool.—The Ecclesiastical Commis have approved plans for the erection of church, dedicated to All Souls, at Sprin Allerton, a new parish formed out of th parishes of Garston, Allerton and Grass Liverpool. The new edifice will follo Neo-Byzantine style, and will occupy a Mather-avenue, which runs through the A Estate. Accommodation will be provid 750 worshippers, when complete. All th and piers will be built in brickwork, face externally and internally with rustic Very little stonework will be employed. floors to the nave and transepts will b with wood blocks on concrete. The c steps and floor will be of stone. The ex roof will be of timber, covered with red pa and will cover a barrel-vaulted interior o forced concrete. Work on the first port the building will be commenced as ea possible, and will provide accommodati 500 persons. The architects are Messrs. bell & Honeyburne, of 51, North John- Liverpool. The quantity surveyors are M W. M. Law & Son, 51, North John- Liverpool.

Richmond, Surrey.—Alterations and add to the old police station in George-stre order to adapt it as a dairy and restaurar the Express Dairy Co., Ltd., 26, Tavis place, W.C.1. Architects, Messrs. Taper Haase, 3, Gower-street, W.1. Messrs. Gri Son, 78, Manchester-road, London, E.14.

OUSING REPORT OF BOROUGH TREASURER, NEWPORT

GH the courtesy of Mr. C. F. Ward, ough Architect of Newport, we have rwarded a copy of a report on the Acts of 1923 and 1924 by the Borough er and Controller, which we find an ly interesting document, and we regret space will only permit us to give a rt notice of some of the points it con- We gather that hitherto the Corpora- der the Chamberlain Act of 1923, has itself to assisting private enterprise noting the construction of houses (1) ing lump sum grants of £110 in the the parlour type house, and £90 in the non-parlour type houses, and (2) guarantees to building societies. In case the Government grant of £6 was as a capital sum of £75, leaving £35 5 respectively to be provided by the ion, but all the applications granted he date of the Report, November 21, re in respect of parlour houses.

f the points which will be considered interest in this report is the com- of schemes it contains with a view to ing, if the Corporation build, whether uld do so under the Act of 1923 with nment grant of £6 for twenty years, the Act of 1924 with a Government £9 for forty years: the rent in the being unrestricted, but in the latter l. It may be noticed here that the un- l rent is taken as 9s. 9d. against a l rent of 8s. 8½d. As we have been o make use of this report, we now e the two tables in which this com- is contained (see Tables I and II).

ecessary now to quote from the Report nents upon and explanations of these les:—

E I.—From this it will be seen that he first sixty years there will be a loss r of a substantial character after the ent grant has been credited, but in twenty years there is a surplus owing oan periods being exhausted, for in obtain a true comparison with , it has been assumed that loans will for periods of twenty years to cover of roads; thirty years for sewers; buildings; and eighty years for land.

t these losses mean.—It is necessary o translate these losses and gains into g the mind will readily seize upon. herefore, calculated that these losses e charged with a certain percentage them each year, and that the gains st twenty years shall be credited with a certain percentage. The result is t if the local authority were to place f £7 3s. 3d. aside for forty years it quidate all the losses after the gains ted.

s under this Scheme.—It will be seen under this scheme the rents are not I have taken them to be at the 9s. 9d. per week, exclusive. It rgued this is not sufficiently high, but be borne in mind that it is assumed sum will be obtained for the period y years and is only 1s. per week of that which is taken into considera- Table II.

Gain and Loss under Table II.

er Table II, which deals with a house ject to ' special conditions ' in respect a State subsidy of £9 per annum for ars is received under the 1924 Act. re given showing the estimated de- over the first sixty years and the the last twenty. Adopting a similar o that used in connection with Table I, f £4 10s. per annum for forty years e out the losses after the gains have dited."

he conclusion to be drawn from these s that it is more economic for a local to adopt the provisions of the Act of 1924 than the Act of 1923, and this result should be anticipated, seeing that under the Act of 1924 the Government grant is £9 for forty years, whereas under the Act of 1923 it is but £6 for twenty years, and it appears to us the tax-payer may well ask, having regard to these figures, whether a case is made out for the larger and longer grant. Some little light is thrown upon this point by a further Table in this Report, giving the comparative annual cost for five hundred houses of the parlour type under the two Acts, and for this purpose the author of the Report has found it necessary for purposes of comparison to reduce the estimated annual deficiencies and surpluses to a common base of forty years. (See Table III.)

These figures surely raise the serious question whether the increased subsidy under the Act of 1924 is called for at all; or whether, having regard to the fact that private enterprise, if placed on an equal footing with the Corporations, would in all probability produce more houses if called for, it should not also apply to houses erected by private builders. The latest figures are given in this Report, showing that 54,287 houses had been authorised to be built by local authorities as against 107,258 by private enterprise. If the same stimulus were offered under the new Act to private enterprise as is offered to local authorities, there is no possible ground for not assuming that private enterprise would continue to lead the way. It really appears to come to this—that the largely increased subsidy and the prolonged period of subsidy are solely offered to secure houses being offered on rental, as it is alleged they are only offered for sale under the Act of 1923.

The increased and long-continued subsidy seems a high price to pay to attain what was the normal condition of things before the war—the letting of working-class dwellings at weekly rents. We are reminded in this Report that the Wheatley programme of 2,500,000 houses involves subsidies from Government and local authorities from 1923-4 to 1979-80 which would aggregate £1,376,240,000, or an average charge per annum for fifty-six years of £24,575,714, and we cannot see that such a commitment can be necessary. The provisions for breaks in the scheme have already done away with one of the reasons which, it was alleged, made it essential to lay down a scheme for so long a period; new methods and increased personnel are sure to be provided to meet a continued demand and, moreover, the sale of houses is a comparatively limited market, and private

TABLE III.

Scheme for 500 Houses.	Equivalent Annual Cost per Annum for 40 years. Government Subsidy.	Corporation Subsidy.	Total.
Under the Act of 1923—			
(*a*) Assistance to private enterprise by lump sum grants	£2,178 17 4	£1,026 8 5	£3,205 5 9
(*b*) Provision of houses by Corporation	£2,178 17 4	£3,581 5 0	£5,760 2 4
Under the Act of 1924—			
Provision of houses by Corporation	£4,500 0 0	£2,250 0 0	£6,750 0 0

enterprise, if encouraged and reassured that rents would be secured, would inevitably revert to the practice of building houses which would be let.

The problem before the Government, therefore, appears to be how to combine all the schemes at present in existence so as to stimulate the local authorities and private enterprise alike, but at the same time, whilst giving reasonable security in the future which shall bring operatives into the building trade, not to pledge either the Government credit or that of the local authorities for such unreasonable sums or for such a long period. At present it appears to us that the nation is being asked to back the slowest horse. The local authorities have hitherto produced fewer houses than private enterprise, yet the subsidy to them has been increased, whilst that to private enterprise remains the same. Moreover, from the figures given in this Report, the difference between restricted and unrestricted rents appears to us to make the difference in the subsidy disproportionate.

We wish we could give more space to the matter contained in the Report itself, as we find it most suggestive and instructive. We have only given a few extracts, and although we have given the tables which show that the Act of 1924 places a less charge on the local authorities than the former Act, it must not be assumed that the Report approves one scheme more than another. There are some very practical criticisms of the Act of 1924, amongst which we may mention the effect on the general credit for all purposes of the local authorities if they are to raise such vast sums with the consequent rise in the interest they will have to pay on loans, and the risk of loss from loans sanctioned for such long periods to include such items as roadworks, sewers and buildings.

A HOUSING SUGGESTION

WE have received a little pamphlet which is entitled "Proposals for National Housing Rental Purchase," which contains a scheme under which by paying 1s. a week more than the economic rent tenants become owners of their houses in twenty years. This is not exactly one of the many untried schemes which are being put forward as suggestions to meet the present emergency, for it has its foundations on actual experiment, as it embodies a scheme initiated by Mr. Harold Morgan, the Secretary to the Shireoaks Colliery Co., Ltd., Worksop, which has been in successful operation for eighteen months in the Colliery Company's new village.

The pamphlet must be read by anyone who wishes to obtain accurate information as to this scheme, and we can only give a very imperfect idea of some of its features. Very briefly, the scheme appears to amount to this: The local authority on the application of a prospective tenant-purchaser would advance the money and pay the builder for the erection of the house, which would be registered in the name of the tenant, subject to a mortgage. The mortgage interest is graduated according to the price of the house Up to the value of £500 it is 2½ per cent., £501 to £600, 3 per cent., and so on. The Government subsidy is to be the difference between the mortgage interest paid by the tenant-purchaser and the interest payable by the local authority or other agency. As the mortgages under the scheme are gradually paid off year by year, and as the subsidy would be payable on the outstanding balance of loans, the subsidy would be a gradually diminishing amount. There are tables in the pamphlet which show in detail how the Government subsidy is arrived at, at varying rates of interest chargeable to the local authority, the maximum cost of the subsidy, and all other necessary questions including the charges, &c., according to the price of the house, but perhaps we can give the best idea of the scheme by quoting from a table in which the working of the scheme is given in reference to a house costing £500, at a weekly rent of 11s. 4d., which with the 1s. added, makes a weekly payment of 12s. 4d. This table gives the amount of the Government subsidy according to various rates of interest at which the local authority has borrowed and shows the working of the scheme for the whole twenty years, but we will take the rate of interest at 4½ per cent., and only show the working of the scheme for three years as the rest can be gathered from that :—

	Loan.	Mortgage interest charged to tenant at 2½ per cent.	Total.	Deduct payments at 12s. 4d. per week.	Balance at end of year.	Government subsidy 2 per cent.
1st year ..	£500 0 0	£12 10 0	£512 10 0	£32 1 4	£480 8 8	£10 0 0
2nd year ..	480 8 8	12 0 3	492 8 11	32 1 4	461 7 7	9 12 2
3rd year ..	460 7 7	11 10 2	471 17 9	32 1 4	439 16 5	9 4 3
20th year	31 9 4	15 9	32 5 1	32 1 4	3 9	12 7

We have given the first three years and the twentieth year.

We may mention that one great advantage claimed for the scheme is that there is no compulsory deposit, as even the finding of a small amount of capital is an obstacle in the way of a working man who desires to acquire a house. But if a deposit is voluntarily paid the tenant at once gets the advantage as the weekly payment is then reduced. It may be mentioned that the scheme provides for registration of title by the local authority, rendering conveyance simple and cheap, and this point bears upon another question, which is also dealt with in the pamphlet, as in cases of misfortune transfer of the house is simple and either a smaller house can be acquired or, as explained in the text, an alternative mortgage can be obtained. We endorse all that the author says as to the advantages of encouraging the working classes to own their own houses, and if these houses could be transferred readily and economically one great obstacle to the workman's purchasing his house, *i.e.*, his uncertainty as to whether he may have to change his neighbourhood, would be got over as, possibly, should this system become universal a sort of "Labour Exchange" of houses could be set up throughout the country.

We consider this scheme well worthy of consideration, and we may mention that the Caterham Urban District Council has in working a scheme somewhat on the same lines. That scheme includes an endowment insurance policy, but a deposit of £40 is required. Mr. Morgan shows how insurance can also be combined with his scheme. In conclusion, we should say that according to Mr. Morgan's pamphlet, where tables will be found showing the maximum cost of the subsidy, it is stated that the Government Subsidy will only be higher than in the 1923 Act in a few cases where 5 per cent. has to be paid for loans, by the local authority, but in only one case where the rate is 4½ per cent., whilst there is every reason to believe that the flat rate would be lower as the average subsidy must show a reduction. He further points out that there is no possibility of any future charge on the rates in the case of houses erected under his scheme.

Infirmary Extension.

Four foundation stones were laid recently in connection with a new wing to the Knaresborough Poor Law Institution Infirmary. The wing, at the north-west of the institution, is to provide thirty additional beds for the female ward at a cost of £3,000. Mr. J. Houfe is the architect.

THE PRIME MINISTER HOUSING

IN his speech at the Albert Hall on D the Prime Minister made an importa nouncement on housing. He is repo having said, "We differ profoundly f Socialists in one matter. We want to se own their homes, and we shall devise e means we can to extend the class of o owner. We want to see more and no private property. We want it more sp

Further on in the speech he is rep saying that for some time there must restriction, as not only in this country several countries in Europe, there has same sequence of events, "the falling building during the war; the resulting of houses; the threatened rise of rent; t vention of the State to protect the tena rise of prices of commodities generally, ing material in particular, and then th of rent to rise in correspondence, the of house building; the attempts of the fill the gap; the failure of the State t gap—and we shall not attempt to f direct building at ruinous prices. We set in action and to stimulate, as Mr Chamberlain has done, the resources o enterprise, and when we have subs increased the number of small houses feel free to decontrol."

This is a good summary of the housing position, and we need not say complete agreement with that part of th which supports private enterprise and ownership, but the subsidy plays an in part in both. Under the Housing Act the private builder has been deliberatel at a disadvantage compared with t authorities, as the avowed object of that to encourage the building and letting o by the local authorities or a society, trustees, or a company, and the increased of £9 in place of £6 only applies to such erecting houses to be let on the "spec ditions."

Various schemes have lately been some of which have been put into actu tice, to enable the working man to house, and the subsidy forms an essen ment in the success of such scheme enables the purchase to be made by the p of annual sums over a period of twent such sums, with the aid of the subsidy, e the economic rent by a very small These schemes have been based upon subsidy, and yet the annual sums pa "purchase rent" are not quite prohibiti it has also been shown that were such adopted on a large scale it is possible flat rate can be applied that the average might be capable of reduction. It is im to note that these schemes only conten subsidy for twenty years and not for f applied to the local authorities and other

No Government ever desires to re measure recently passed by its predeces the same objection cannot be applied amendment of that measure, and it appli less to the Act of 1924 than to ordinar since that Act is made subject to a pe review, and any amendment should be c to doing away with the inequality of the to private persons under the Act of compared with the subsidy to local aut and other bodies under the Act of 1924. increased subsidy of £9 could be given to persons erecting houses, even were the twenty years in place of forty years, an this subsidy take the form of a lump could the lesser subsidy under the Act o an incentive would be given to private to accept the "special conditions" as to which are imposed under the Act of 192 we imagine the object which the Prime M has at heart—the stimulation of private prise—would be considerably forwarded if his second object, "house owning," is be facilitated, we should suggest th "special conditions" also require amen so as to embrace such "rental purchase" s as we have referred to above.

W BUILDINGS IN LONDON

rk.—The Bishop of Southwark has appeal for funds to enable a much-eme of restoration and repair to the to be carried out. It is hoped to raise nd to make reparations to the fabric organ, install a better lighting system, plans have been prepared by the architect, Mr. Charles J. In being erected an up-to-date, modern se, for Messrs. Huggins & Co., Ltd., s and owners of the property. The uilding consists mainly of brickwork r construction, with a faience front, nd asphalted roof. Efficient systems lighting and heating are being The contractors for this work are A. Roome & Co., Ltd., of Hackney. ect for the scheme is Mr. Alfred Burr, , 85, Gower-street, E.C.2.

-place.—A large site in Waterloo-he east side, is now being excavated y to building operations being started. ding of offices is to be erected, of five height. The premises will be of a ilar to the building of Cox's Bank and are, in fact, designed by Mr. Crown, of 12, Regent-street, S.W.1, one t architects to the bank. A steel will carry the building, which will be Portland stone. The floors will all ncrete construction, finished with The interior equipment will include ve the floors above, heating and elec-g systems, &c. The windows will all steel casement type, and a certain art metal work will be introduced. ill be a mansard and will be covered . The contractors are Messrs. Holland and Cubitts, Ltd., of 258, Gray's Inn-lon, W.C.1.

h-street.—The site at the corner of -street and Billiter-street, London, been cleared of old buildings, the ses being expired, and a new block of be erected in their stead. The new ill incorporate all modern improve-will provide six floors of offices, all r letting purposes. A Portland stone ilding carried on a steel girder frame-be erected, with its entrance on the e site. Heating on the low-pressure system from a central boiler-house talled and a lift, worked by electrical l run from the basement to the top entrance and lobby will be paved in d the joinery work will be in mahogany. ects are Messrs. Gunton & Gunton, of House, Bloomfield-street, London,

l-street.—A five-story warehouse is to n the site of Nos. 6 and 8, Stamford-l, for Messrs. Burn Bros. (London), ary engineers, &c., of Blackfriars-road, he new building is to be of brick facings dressings for windows and doorways. l be accommodation for offices and space and the floors will be of fireproof he loads will be carried by a steel plied and erected by Messrs. Redpath Co., Ltd., of 3, Laurence Pountney-3. The roof will be of slate. The s are Messrs. Higgs & Hill, Ltd., of Crown Works, South Lambeth-road, London, S.W.8. The architect is Mr. T. H. Smith, of 17, Basinghall-street, London, E.C.2.

Regent-street.—Another new building in Regent-street is to be provided on the site of Nos. 149–151, Here will be erected a six-floored block of offices and shops, with extensive basements. The premises will be similar to all of those in this street, built of Portland stone facings, on a steel framework. The floors will be of fireproof construction, whilst the walls will be of fibrous and plain plaster decoration. Marble will be used for linings and skirtings on the principal entrances and corridors. All joinery will be in English and foreign hardwoods. Lifts will be fitted to serve all floors. Electric lighting will be installed and central heating on the low-pressure system will be provided. Points for fitting vacuum cleaning apparatus will also be wired on each floor. The shop windows will be of metal, of ornamental design, with bronze lettering. All other casements will be of steel, The general contractors are Messrs. Trollope & Colls, Ltd., 5, Coleman-street, London, E.C.2. The steelwork frame will be supplied and erected by Messrs. Moreland, Hayne & Co., Ltd., of 80, Goswell-road, London, E.C.1. The architects are Messrs. Skipwith, Gordon & Gordon, of 5, Old Bond-street, London, W.1.

Regent-street.—Building is to commence this month on the new shops and offices designed to replace the old premises at Nos. 93, 95, 97 and 97A, Regent-street, with large frontages also in Swallow-street. The new building will be six stories in height, and excavations to a depth of about 30 ft. is being made to provide for two basements. There will be four large shops on the street level, with showrooms above and below if required. The first to fifth floors will be used as offices, &c. The front elevation has been approved by H.M. Office of Works and Forests and will be executed in Portland stone, enriched with bronze ornamentations and art metal decorative work. The mansard roof will be covered with green Cumberland slates on the pitched slopes and will have a top roof of concrete, finished with asphalte. A steel-framed building, it will be rendered fireproof throughout by the provision of reinforced concrete floors, doors, sprinklers and hydrants. Steel casements will be used for all windows, whilst the display fronts for the shops will be of bronze or brass. There will be two lifts and complete systems of heating, lighting, ventilating and vacuum cleaning. The architect is Mr. S. Gordon Jeeves, of George-street, Hanover-square, W.1.

Sutton-lane.—The licensed premises, the "Queen's Head," at Sutton-lane, Chiswick, W.4. are to be rebuilt upon the present site and the accommodation practically trebled. The new building will be of three stories, and will be erected in brickwork with steel girders placed to carry the principal loads, A certain amount of timberwork on the front of the house is provided for. Inside the equipment and fittings will be of oak or mahogany. Plans have been prepared by Mr. Malcolm T. Sanders, architect, to Messrs. Watney, Combe, Reid & Co., Ltd., the owners of the premises.

Strand-on-the-Green.—The "Steam Packet" in Strand-on-the-Green is to be rebuilt. A building of the half-timbered style is proposed, erected in good quality facing brick, and a slated roof. Accommodation will be provided for private and public bars, luncheon room, domestic and staff quarters, lavatory, cellarage, offices, &c. The interior woodwork will be chiefly of oak, whilst the walls will be of plaster and distempered. The architect is Mr. Nowell Parr, of 42, Cranley-gardens, South Kensington, S.W.7.

Coldharbour.—The Coldharbour Estate at Croydon is to be developed for housing purposes and an expenditure of about £10,000 is anticipated on the lay-out of new roads and the provision of houses. Various designs for houses and residences will be adopted, providing three and four bedrooms, living room and parlour accommodation, &c. The surveyors to the Coldharbour Estate, Ltd., are Messrs. Hooker & Rogers, of 4, High-street, Croydon.

Haywards Heath.—A new church for the Roman Catholic denomination is to be built at Haywards Heath, and building operations are likely to start in the near future. Plans for an edifice of brick erection with stone dressings is proposed, to hold about 300. The interior will be finished in plaster and distempered. The furnishings will be in oak. The architect is Mr. John H. Beart Foss, of 9, The Common, Ealing, London, W.5.

Gray's Inn-road.—A row of shop premises is to be erected in Gray's Inn-road, constructed in brick, with artificial stone dressings and mahogany shop fronts. The contractors are Messrs. W. F. Blay, Ltd., of Spital-street, Dartford and Dowgate Hill, E C.4. The architects are Messrs. North, Robin & Wilsdon, 35–39, Maddox-street, W.1.

London Wall.—The premises known as Glendinning Restaurant at No. 34, London Wall, E.C.2, have been acquired by a building society for new offices. Internal alterations are to be made and electric lighting and heating apparatus installed. The architect is Mr. J. H. Lovegrove, of 374, Old-street, London, E.C.2.

Old Bond-st.—The large premises at the corner of Burlington-gardens and Old Bond-street, W.1, known as No. 24 in the latter street, and owned by Messrs. J. & E. Atkinson, Ltd., the perfumers, are to be rebuilt. The new building will be designed in the Tudor style and its Portland stone elevations to Old Bond-street and Burlington-gardens will be enriched with all the ornamentations of that period. There will be six floors in all, of which the ground floor will be used by Messrs. Atkinson as a shop and showroom. The fittings and shop windows will all be in oak and carved in the Tudor manner, Leaded and glazed window casements will also be in keeping with the architecture. The floors will be of concrete. The roof will be pitched, with dormer window openings, and will be covered wih lead sheeting. The rain-water pipes and heads will be cast-iron or lead. The architect is Mr. E. Vincent Harris, F.R.I.B.A., of 29, St. James's-square, London, S.W.1.

The Lodge, Aldershot.

In the advertisement of "The Edwardian Down Draught Prevention Chimney Pot" of the Fawcett Construction Co., Ltd., 65, Victoria-street, Westminster, S.W., in our last issue, an illustration was given of The Lodge, Aldershot. The name of the architects was printed incorrectly, and should have read Messrs. Kingham & Kingham, Aldershot.

Ionic Cap at New Premises at Broadway, Westminster.

[This Cap was designed by Messrs. John Daymond & Sons, Ltd. The architect of the building, which was illustrated in our issue for November 28, is Mr. H. J. S. Abrams.]

WORKMEN'S COMPENSATION

Winding up Orders.

An important point in connection with the new Workmen's Compensation Act of this year has been decided by a Divisional Court in the case in the matter of Clemmons Aluminium, Ltd. (*The Times*, November 26). A workman in the employ of the Company had suffered injuries by accident which had resulted in total disablement, and he had been paid weekly payments as compensation, until in September, 1923, the Company went into liquidation. Under section 5 of the principal Act, the Workmen's Compensation Act, 1906, sums due in respect of compensation were made debts entitled to preferential payment, but only to the extent of £100 in any individual case, and where the compensation was a weekly payment for the purposes of this provision it was to be taken to be the amount of a lump sum for which the weekly payments could be redeemed, as if the employer made an application under Schedule I par. (17) of the principal Act. The sum in this case so assessed amounted to £950.

Section 19 of the new Act has considerably amended section 5 of the old Act. Where the insolvent company has entered into a contract with insurers by subsection (1), the rights of the Company against the insurers are transferred to and vested in the workman, but where no such contract has been entered into the amount due in respect of any compensation, the liability wherefor accrued before the appointment of a receiver, or of debenture holders taking possession, shall be included amongst the debts which, under section 107 of the Companies (Consolidation) Act, 1908, are to be paid in priority to all other debts. Then in subsection (2) of the above section 19 it is provided "The limitation to £100 in any individual case on the amounts due by way of compensation which under section 5 subsection (3) of the principal Act are to be included in the debts to be paid in priority to other debts in the case of a bankruptcy or winding-up shall cease to have effect."

The question raised in this case was whether the new Act applied, the winding-up proceedings having commenced in September, 1923, but not been completed, nor the above lump sum paid, before January 1, 1924, when the new Act came into operation, and it will be seen if the old Act was to apply only £100 of this sum could be treated as a preferential debt, whereas if the new Act applied the whole sum would be so treated.

The Court held that the old Act remains in force where existing rights were in force before the new Act came into operation, for it was a general rule that an interpretation should not be placed on an Act which was prejudicial to existing and accrued rights if that could be avoided. There would be other rights which had accrued to other persons in such a case as this, and unless a contrary intention was expressed in the new Act, the rule of interpretation in section 38 of the Interpretation Act, 1889, applied that former Acts were not to be taken as repealed. Section 19 subsection (1) of the Workmen's Compensation Act, 1923, was clearly a prospective provision, and subsection (2) was in general terms and did not repeal the £100 limit.

The result was that until the new Act came into force the right to a priority in payment was governed by the old Act.

New Bridge Across the Tyne.

Newcastle City Council recently agreed to accept the tender of Messrs. Dorman Long & Co., at a price of £571,225, for the construction of a bridge across the Tyne between Newcastle and Gateshead, for which an Act of Parliament has been obtained. This was the lowest tender. The next was that of Messrs. Cleveland Bridge & Engineering Co., at £604,421. The highest tender was £743,938. The cost of the works will be approximately £1,000,000.

South Esk Bridge.

ose Bridge Joint Committee recently to make application to the Ministry of rt for a grant of 65 per cent. for a bridge ected over the River South Esk, accordhe plan submitted on August 23, and g for a 24 ft. roadway, at an approxist of £88,000.

THE SCOTTISH BUILDER

SCOTTISH ECCLESIOLOGICAL SOCIETY

A MEETING of the Edinburgh District of the Scottish Ecclesiological Society was recently held in St. Cuthbert's Hall, Edinburgh. Mr. Thomas Ross, LL.D., presided.

Professor Charles Gourlay, B.Sc., F.R.I.B.A., of the Royal Technical College, Glasgow, delivered a lecture on Glasgow Cathedral. In the course of his remarks the lecturer said that the essential parts of most cathedrals were generally placed on practically one floor level, and these might be divided into two sections—respectively east and west of the "crossing." The eastern section in Glasgow Cathedral was unique in that it consisted of two stories, which in all old documents were referred to as lower and upper churches, but these terms did not convey the essential unity of the eastern arm of the Cathedral. As its site was one which sloped steeply downwards to a river towards the east, this led to the development of the design as executed, which was a work of genius on the part of the original designer, who produced in this portion the outstanding glory of the Cathedral. The placing of the high altar on the upper level gave the rightful prominence to this floor, while the placing of the Lady Chapel and the Chapel of St. Kentigern on the lower floor made it the necessary complement of the upper. The lecturer then showed the important influence of processions in the design of a mediæval cathedral plan by describing the ceremonial of the Sunday procession, and then proceeded to deal with the historical growth of the Cathedral. The first church on the site was that erected by St. Kentigern, and it probably occupied the south-west compartment of the present Lower Church. In 1115 David I of Scotland appointed his Chancellor, John Achains, to the bishopric, and John began the first Cathedral, which was consecrated in 1136. Its style would be Romanesque, but of its plan they had no knowledge.

The rough diagonal tooling, upwards to the left, to be seen on the surface of the stone wall near the Jocelin wall-shaft made it probable that a fragment of this Cathedral might yet remain. The 1136 Cathedral was burned down in 1176, and Bishop Jocelin rebuilt it, but only the wall-shaft named after him now remained. These fragments of early cathedrals being left in situ by later builders suggested that they marked a sacred spot, and the oldest sacred spot known to have existed within the building was the original grave of St. Kentigern, who was recorded to have been buried at the right-hand side of the altar in his church. The veneration paid to the resting-places of saints by pilgrims in the thirteenth century often led to the removal of their relics from inconvenient positions and their enshrinement in saints' chapels, and this appeared to have occurred in Glasgow Cathedral. A study of the base courses still existing showed that the Cathedral begun by Bishop Malvoisin about the year 1200 included the north and south walls of the present nave and transepts, while Bishop Walter built the wall and vault of the Lower Church and part of the north and south walls of the nave, with their responds. The next great building Bishop was Bondington, who built the eastern arm of the Cathedral, and continued the building of the parts already begun. Bishop Wishart redesigned the nave, but retained the old setting-out, which led to his executing the most beautiful combination of triforium and clerestory of this period now existing. Bishop Lauder built the tower, also part of the chapter-house, which was continued by Bishop Turnbull and completed by Bishop Cameron, who built the spire. Blacader's "aisle" was built by Archbishop Blacader between 1484 and 1508 to provide additional altars, but its upper story was never erected.

At the conclusion of the lecture Sir James Balfour Paul moved a cordial vote of thanks to Professor Gourlay.

NEW BUILDINGS IN SCOTLAND

Kilmarnock.—BUILDINGS.—The Dean of Guild Court has passed plans: Buildings in Lawson-street, in connection with spinning mill, for Douglas Reyburn & Co., at a probable cost of £150; buildings in Market-lane, in connection with extension to restaurant premises, for David T. Lauder & Son, at a probable cost of £900; bungalow in Knockinlaw-road, for G. Gilmour, at a probable cost of £725.

Dunoon.—COTTAGES.—The Dean of Guild Court has passed plans: Cottage at Kilbride-avenue, for R. Malloch; cottage, Alexander-street, for D. Campbell; cottages, Nelson-street and Alexander-street, for A. T. & J. T. Colquhoun.

Falkirk.—WAREHOUSE.—The Dean of Guild Court passed plans: Callendar Iron Co., Ltd., warehouse and fitting shop, at a probable cost of £1,250; bungalow, Major's-place, Falkirk, for J. Kean.

Glasgow War Memorial.

A war memorial to Glasgow Territorial R.A.M.C. units was recently unveiled by General Sir William Leishman, K.C.B., in the Cathedral. It is from a design by Mr. G. M. Brand, architect, Glasgow.

Clyde Bridge Banned.

The Glasgow Corporation recently decided to approve of the Provisional Orders promoted by the Corporation, with the exception of that part referring to the construction of the new bridge. A motion that this should be abandoned was carried by 38 votes to 19. The view was expressed that if this bridge were erected, and with the completion of the new bridge at Oswald-street, there would be four cross-river bridges within a short distance. The suggestion was made, however, that a bridge further down the river, possibly in the vicinity of the Finnieston district, would be more serviceable.

ILDING TRADE WAGES IN SCOTLAND.*

THE BUILDER

JOURNAL FOR THE ARCHITECT AND CONSTRUCTOR.

WITH WHICH IS INCORPORATED "THE BRITISH ARCHITECT."

JL.—No. 4272. DECEMBER 19, 1924.

APPRECIATIONS AND CRITICISMS

WE welcome Professor Reilly's book* in a year which will be notable for the increased interest taken in architecture by the general public, and for the number of books which have been written on the subject to appeal to the layman. This is a book ining twenty-four critical essays, several of which have dy appeared in various papers. That they stand the test ok form is a tribute to the author's skill as a writer, and e grateful to him for his decision to publish these essays in anent form.

hat critics should have their standards and that artists d know their craft are two of the last points which anyone l think of disputing. These things are common ground, n architectural matters it is not generally recognised that ublic, in seeking for guidance in the appreciation of living tecture, places a difficult and delicate task upon the critic. fact that architecture has the grain of vice in it—that it ens to be useful—has secured for it a certain amount of nity from criticism. As an architectural critic, Professor stands in the front rank, and it is when he is frankly ng with architecture that we like him best in this book. tecture as an expression of civilisation is one thing, but n of civilisation developed to suit architecture is another. scusses a number of architectural problems: he criticises anks and our railway stations, our suburban houses and eligious buildings, our offices and our streets in a manner is thoroughly interesting. His essay on Liverpool dral is handled delightfully, and on the subject of Regent- he displays an ease and mastery of his subject in language ar and untechnical that the layman cannot fail to appre- both the problem and the evenly-balanced criticism.

e is a fearless critic of men and manners, and we enjoy his ous criticisms and applaud his palpable hits, particularly we feel that we are immune. This is a human foible, but te this sparkling criticism, and we would like more of it. a healthy corrective, even if we are not convinced that nplete philosophy of architectural criticism has yet been d out. "No one," he says, "writes to the papers to hat a vulgar and pretentious building the new War Office Perhaps not, although no doubt it would be safe enough t it; but we cannot help wondering how much the average ect and his client have a right to expect in the way of ited censure and criticism, while attending to the everyday ess (to them) of solving a practical problem. Admittedly, n of vulgarity lies between the two of them: we do not o excuse them, but we question the legality of the attitude assumes freedom to attack without penalty. No one avil at what is said in this book about railway and bank ors and public authorities: they have a public duty to m, and must be prepared to accept criticism.

king a line through the various essays, it is difficult to r whether the architect or the public is most to blame for esent low standard of architecture throughout the country. sense this difficulty lies at the root of the whole problem hitectural taste, and failing any very definite conclusions ust assume that the criticisms in the book before us apply the cap fits. In Italy, for instance, we see a real cular form of architectural expression which we are to ie is the work of folk who do it instinctively. On the hand, "the be-columned and be-swagged, the over- d and under-mannered structures we know so well," must be the work of architects. If we admit that the life which architects interpret into brick and stone is a "sordid materialistic life," either the architect is part and parcel of it, or we expect him to rise above it and give us something better in the same way that "the distinguishing note of modern American architecture is scholarship." A sense of civic values can be taught but it is by no means certain that we ought to accept the architect's conception of social values, which presumably he will distinguish for us by a comprehensive but subtle range of accessories and symbols. The science of political economy makes no ethical distinctions between the banker and the money-lender, or between the merchant prince of Venice and the retailer of "soft goods" in Oxford-street. If architects "use up our finest symbols" on certain buildings, the fault lies with the architect not with our social state. Architecture must lengthen its stride.

Comparing our architecture with that of modern America, Professor Reilly makes a point that no one can say of the mass of undigested nationalities which at present makes up the great United States, that, like the Greeks of old, they are a race of artists. Yet, as he says, "their advance in the oldest and noblest of the arts has not only been relatively greater than ours, but their absolute achievement has been immeasurably greater, too." We fancy that here we are likely to find the answer to many critics of architecture who lay the whole blame upon that elusive factor—public taste. The general reader will, therefore, take heart of grace when he has read this book. He is accustomed to periodical scourgings for his appalling taste in architecture, and although he does not escape severe criticism from the author, he will feel that justice is being dealt out, and that the blame is not entirely at his door. We do not think the golden age of architecture is produced by clients with sufficient taste to demand it from their architects; on the contrary, we think that the author's philosophy holds out the real hope for the future. "After all," he says, "it is not the opportunities either of site or money which make great architecture, but the men who design it."

It is rather an abrupt change to jump from a discussion upon the qualities of fine architecture to a discussion upon the relationship between the architect and the builder. The essay on the Anti-Social Contract is a soundly reasoned contribution upon a subject which not only deals with human relationships, but affects the practical application of architecture in the social state. This essay has a distinct bearing on the comment in a subsequent essay on Bath, to the effect that there is something to be said for the combination in one person of architect, builder and owner, as shown by the examples of the brothers Adam, and Wood and his son at Bath. Professor Reilly puts his finger on the weakest link in the long chain between the architect, and his completed building. "Why should the builder be on one side, and the architect on the other? Why should they not be colleagues from first to last, each helping the other with his experience?" We heartily endorse the sentiment underlying these inquiries, feeling certain that the more this breach is narrowed the greater will be the gain for architecture and the general public. A practical solution which abolishes the system of cut-throat tendering is suggested in the essay, and undoubtedly there is much to commend it. But surely there is another very obvious side to what should be a social contract. It is this: The builder is necessary to the architect but is the architect considered necessary either to the builder or by the builder? We are not attempting to excuse the existence of contracts which produce unsatisfactory buildings; on the contrary, we are explaining why the great majority of the buildings in the country are mere buildings devoid of architectural grace.

There are limits to a book review, and we cannot deal with many other interesting questions raised in this book. Our readers will find excellent entertainment in the author's criticisms and philosophy, and many will find that living architecture may hold a fresh interest for them.

---

*"Some Architectural Problems of To-day." By C. H. Reilly, , M.A., F.R.I.B.A. The University Press of Liverpool, Ltd.; r & Stoughton, Ltd. Price 6s.

NOTES.

The New President of the R.A.

Of the accomplishments of the new President of the Royal Academy, Mr. Frank Dicksee, or of his fitness for his distinguished post, there can be no question. If his election appears to suggest that we are again unde the influence of the long-established tradition that art is mainly concerned with picture-making, we may at least rest assured that the new President, with his long experience and ability, is not unsympathetic to the present desire for reform, progress and more catholicity of vision. It might be well if, before many years elapse, we find a sculptor and yet another architect occupying the presidential chair if the best results of a real Academy of Arts are to be attained. At any rate, all that is best in the traditions of the Academy are at present in worthy hands.

American Institute Gold Medal.

Sir Edwin L. Lutyens, R.A., Vice-President of the Royal Institute of British Architects, has just been informed that he has been awarded the Gold Medal of the American Institute of Architects, and he has been invited to attend the Architectural Convention in New York in April, 1925, to receive the medal in person. This is the first occasion for seventeen years that the Gold Medal of the American Institute has been awarded to a British architect, the last occasion being in 1907, when it was awarded to Sir Aston Webb.

The Architectural Association.

Mr. H. S. Goodhart Rendel, F.R.I.B.A., the President, assisted by the Hon. Mrs. Wilbraham Cooper, received the members and guests at the A.A. headquarters at Bedford-square on Thursday last week. Despite the fog the attendance was large. A capital musical programme was provided and in addition an exhibition of members' holiday sketches was on view, also a series of photographs taken during the A.A. excursion to Spain. A pleasant evening was spent, which brought many old friends together once more, and dancing was an enjoyable part of the programme.

Non-Party Housing.

The housing of the poorer population is likely to remain a subject of almost predominant importance for some time, and every time a serious discussion on the subject arises we feel an increasing sense of the desirability that it should not be made a mere butt in party politics. The words of reasonable courtesy and consideration which passed in Parliament on Tuesday between Mr. Chamberlain and Mr. Wheatley really afford some glimmerings of hope for this wider and more generous outlook.

Steel Houses.

The chief interest in the discussion on the Government's housing policy in the House of Commons on Tuesday was the statement by the Minister of Health on the arrangements made for the production of a certain number of demonstration or experimental steel houses to be supplied to local authorities. A sum of money has been set aside from which a grant will be made to any local authority that is taking these particular experimental houses, the local authority not to let them to begin with, but to erect them in some spot where they can be readily visited and inspected by the public. This is, no doubt, a wise step to take, and it will enable local authorities to test public opinion before any drastic steps are taken in mass production. According to Mr. Chamberlain (the Minister of Health), "A considerable number of types will probably be submitted to public approval, but ultimately they will perhaps get down to two or three. If this experiment is successful, it will have several advantages. The production of this type can be multiplied indefinitely; the materials are sort for the production of whi capacity of this country is far in of the present demand; it is than the type of house of which w knowledge at present; and give a large amount of employn just that section of the community is most in need of it." It would from this that efforts will be m popularise this type of productio if they are successful the result n be to our liking, but it will pr supplemental supply of houses, is, of course, our first need.

Gilbert's Fountain.

The removal of thi tain from its site in dilly-circus is requi order to carry on t underground extension schemes progress which need the site purpose. We understand tha present intention is to remove temporarily and that it can be r a year later. It seems that this is an tunity for providing a better site. not able to make the great claims fountain which some have felt, should be given a situation more ing with its character, which is mor to garden surroundings than Pic circus. Leicester-square suggests a more suitable spot, where it replace the extremely negligible speare statue at present occupy centre.

Old and New.

The old stone bridg the River Frome at ham, Dorset, has inadequate for the t these days. In the Georgian bridge was regarded as so valuab a tablet then placed on the brid remaining to this day, states that person wilfully injuring any part County Bridge will be guilty of and upon conviction liable to be ported for life." Preparations fo seding the old bridge by one s adapted to the needs of the motor the lorry and the touring car understand, going forward as can in the photograph on page 965.

Waterloo Bridge.

The temporary alongside the W Bridge is expected completed about nex and until then no attempt will b to do anything with experiment the reconstruction of the old bridg can hardly doubt that the reque the London County Council for the of the Institution of Civil Enginee the practicability of restoring W Bridge in its original form will be me Institution affirmative, but there opposition to such action from th place modern convenience and c ment before everything else. Thi to say that modern development w best served by an entirely new b by a new position for it, but or

An old Shop-Front, Haymarket

An Old Shop-Front, Cornhill.

may be many who think so. Surely e can doubt, in view of all the con- tions advanced on the subject of ridges, that it is of the utmost tance for the whole subject to be seriously considered with proper ght for the future and in relation to eat importance of our bridge designs future amenity of London. Water- nd London Bridges have some e architectural values, and there is reason to demand an equally satis- y treatment for any new ones that rojected. A devout hope was ssed at the meeting of the Council 10th instant that the City Corpora- nd the County Council might come ne reasonable agreement on this question.

---

cal eums.

There are many who will echo the wish of Captain Shore in his letter in our last issue that exhibits of local ological interest should be found in ighbourhood to which they apply. In numerous instances the exhibition locally would be of far greater interest and value than in the great store of the British Museum.

Old Bridges.

The problem of old bridges and the requirements of mechanical transport presents a very serious problem. Transport having outgrown the accommodation provided, they are no longer adequate to modern industrial conditions. It is perhaps a case of bowing to the inevitable, but their destruction cannot be regarded with indifference, and the trouble is that public opinion is so little organised that the motor interests have it all their own way. And yet there are other interests no less important and to which we think commerce ought to bow, though interests of much difficulty to vindicate. The beauty and historical associations of the countryside are worthy of attention, and their attraction to visitors is also of commercial value, and it appears to us that in many instances we are only sacrificing one interest to another when we disfigure and alter the ancient character of the countryside. The old bridge at Grasmere, so long associated with this quiet spot, hard by the ancient church, has to be widened to fit it to the increased traffic needs. So we alter the features that attract the tourist, and mutilate that which it is their object in coming to see, and for which reason the old bridge is to be mutilated! The old bridge at Rotherham is another case. This ancient bridge has a chantry on it, and it is in danger, as are others too numerous to mention. This growing menace to the historical and archæological interests of the country concerns us all.

British Institute of Industrial Art.

The exhibition now opened at the Whitworth Institute Galleries, Manchester, will, we hope, promote the interest in good craftsmanship and bring before the manufacturer of the Midlands standards of design and treatment which may influence his own production. It is difficult to avoid a certain sameness and want of freshness in these exhibitions, and the work shown tends to confine itself within familiar examples of a few good craftsmen's work and a large contribution of very average attainment. We could wish it were possible to strengthen the exhibition with work drawn from newer sources, though we appreciate the reluctance of the fine craftsman to see the advantage of such participation, and we miss some significant names. We can, however, see the evidence of some improvement if we look for it, and to this the Institute is contributing by the better examples it is bringing before the manufacturer. One bit of work really done properly, with due consideration of the restraints of fitness and becoming ornament, and shown in the ordinary ways of publicity, will do more than much precept and exhibition display, and it is a question whether the results of such fostering repay the expenses.

The Old Stone Bridge Across the River Frome at Wareham, Dorset.
[Preparations for building a modern iron structure are seen on the left.]

GENERAL NEWS

Christmas Holidays.

In consequence of the Christmas Holidays we shall be going to press next Monday. All communications to the Editor must reach the office first post Monday morning.

Professional Announcements.

Mr. R. H. Willson, Lic.R.I.B.A., has opened an office at 22A, Victoria-square, Aberdare Telephone : Aberdare 252. The Aberaman office will be open for appointments as usual.

Mr. A. Robert Bowles, M.S.A., has removed to 143A, Sandgate-road, Folkestone.

Obituary.

The death has occurred at Cleobarrow, Cockton Hill, of Mr. Fred H. Livesay, aged 55. a well-known Bishop Auckland architect.

The death occurred at his residence in Edin burgh recently, at the age of 80, of Mr. William D. M'Kay, R.S.A., LL.D., secretary of the Royal Scottish Academy since 1907.

Architect's Estate.

Mr. Frank Harold Collyer, of Birkland-avenue, Mapperley, Notts. architect (net personalty, £8,160), £12,413.

The Royal Infirmary.

Plans were recently passed at Edinburgh Dean of Guild Court in connection with the Radiological Department to be erected at the Royal Infirmary, Edinburgh. According to estimation, the building will cost £40,000. The building will be of reinforced concrete, and have two floors, with a large basement. A system of artificial ventilation, by mechanical extraction, throughout the building will be employed.

Rotherham Chantry Bridge.

Chantry Bridge, at Rotherham, was mentioned recently at a meeting of Rotherham Town Council. With regard to the objections of the Archæological Society, the Council were desirous of saving the old portion of the bridge, and retaining the old chapel. The new construction was to be of concrete, with an 80 ft. clear span. It would be 60 ft. wide, with a 36 ft. carriage way. The cost would amount to £90,000.

Dundeee Concrete Houses.

At a meeting of Dundee Town Council recently it was agreed to erect 200 concrete houses of the pier and panel system invented by Messrs. H. Boot & Son, Ltd. The Council resolved that direct labour should be employed, but only so far as the concrete part of the construction was concerned, the joiner work being left in the hands of private enterprise. Lord Provost High pointed out that the Caird Hall was built of concrete, and there was no crack or mark in it. Mr. W. H. Buist said that there were 5,473 unemployed men on the register of the Labour Exchange of Dundee. That was one of the reasons for going on with this scheme and allowing the City Engineer to have charge of the direct labour.

Poplar Flats.

Messrs. William Simms, Stepney, E.1, are the contractors for a block of 24 flats to be erected for the Poplar Council.

Department of Overseas Trade.

His Majesty's Senior Trade Commissioner in Canada reports that a company in Montreal is proceeding with the construction of an apartment house (block of flats) which it is considered will be the largest building of this kind in Canada, and that in consequence there is likely to be a demand for materials for interior decoration, roofing, &c. United Kingdom firms desirous of obtaining further particulars should apply to the Department of Overseas Trade, 35, Old Queen-street, London, S.W.1.

His Majesty's Trade Commissioner at Vancouver, B.C., reports that a local departmental store firm has decided entirely to rebuild their store premises in that city, and that the architects concerned are about to call for tenders for the supply of lighting, heating installation and refrigerating plant. United Kingdom firms can obtain further particulars on application to the Department of Overseas Trade, quoting reference AX. 1552.

Building Apprentices.

Mr. H. Matthews, president of the National Federation of Building Trade Employers, in a speech at Lancaster recently, said employers in the building trade were agreed that there was room for 35,000 apprentices, so that there would be one apprentice to every three operatives.

Benwell Colliery Baths.

The Benwell Colliery pit-head baths were recently opened. These baths are the third group of their type in the county, similar ones having been erected at Newbiggin and Ellerton. There are 32 baths at Benwell, for the accommodation of 400 men, and they are housed in a building erected near to the winding shaft of the Charlotte Pit and close to Condercum-road. The building was designed by Messrs. Cackett & Burns Dick, FF.R.I.B.A., Newcastle, and built by Messrs. J. & W. Lowry. The heating, hot water and bath arrangements were executed by Mr. R. W. Cairns, Newcastle.

CORRESPONDENCE

Plumbers and Housing.

SIR,—The ramification of Building Industry Committees is notorious, but my executive regret that this difficulty should have led to the paragraph in your Notes of December 5, entitled "Plumbers and Housing."

The Institute of Plumbers is a member both of the Building Industry Committee set up by the Minister of Health, and of the National Apprenticeship Council for the Plumbing Industry. The former body is distinctly concerned with housing policy and augmented apprenticeship, and has our entire support.

The postponement of a meeting of the latter body, which is concerned with normal apprenticeship, is a domestic matter, and has no immediate bearing upon housing policy, and is conditioned by the internal reorganisation of the Master Plumbers' organisation, which we hope will lead not to a lessened, but an increased interest and attention to apprenticeship matters. My executive trust you will publish this correction and suggest that inquiries from the undersigned would have avoided the misapprehensions your paragraph must have caused.

H. BLACKMAN,
Secretary.

[*** We gladly publish this letter. Many of the circumstances that led to the postponement of this conference were known, but as they were "domestic," were not published. But even if the unexpected change of plan had no "immediate" bearing on housing policy, it certainly had an immediate repercussion upon those who are advising the Government on this question, and an effect possibly wider than was realised by the Institute of Plumbers at the time.—ED.]

Housing Finance.

SIR,—A solution of the housing problem might be found if the Government set aside £1,000,000 as a guarantee to the banks against a total 10 per cent. loss; this would release £10,000,000 to builders for housing. £10,000,000 would employ, back up, and create 10,000 small building firms, employing, say, only 10 men each—100,000 men.

If each firm builds only 10 houses in each twelve months, that represents 100,000 homes—a gain to the country and a risk to none. The writer has employed 2,000 hands.

Pulborough. W.

COMPETITION NE

Christian Science Hall, Southport

The assessors, Messrs. J. E. Sanders A.R.I.B.A., have made the following a this competition :—(1) £75, Mr. W. Sinclair, F.R.I.B.A., 8, Buckinghar Strand, London; (2) £50, Messrs. Thomas & Button, 14, Acresfield, (3) £30, Mr. Herbert Longman, F.R.I. Hoghton-street, Southport. The design on view at the Trinity Wesleyan Sch Talbot-street, Southport, from 2 o'c 4.30 on Monday, December 15, to December 19, and Saturday, December 9.30 to 12 o'clock.

Concrete Cottages.

The following awards have been mad competition :—(1) 30 guineas : Mr. Sharp, F.R.I.B.A., Westminster Cham Victoria-street, Westminster, S.W.1. Guineas : Messrs. E. R. Hudson A.R.I.B.A., 69, Warwick-square, West S.W.1.

The Constantine Technical Colleg

Architects are invited to submit de this competition. Mr. Percy F.R.I.B.A., has been appointed assess conditions can be obtained from the S on the payment of £1 1s., not later than ber 27. Sending in day, May 15, 192 our last issue.)

Leeds Library.

Designs are invited from architects Riding only for a library to be erecte Compton-road estate. Mr. Percy S. W ton, F.R.I.B.A., is the assessor; premi £20, and £15. Conditions, on the pay £1 1s., from the Town Clerk, Leeds Se day February 16, 1925.

New Offices, Nairobi.

Designs are invited for new railwa to be erected in Nairobi, Kenya Colon miums of £200 and £100 are offered resp Conditions can be obtained, not lat February, on the payment of one guin the Crown Agents for the Colonies, M The assessor is Mr. William Dunn, F. Sending-in day at the offices of the Nairobi, February 28, 1925. (See our November 7.)

Heating and Ventilating.

The Council of the Institution of and Ventilating Engineers offer the prizes to assistants for original pa subjects connected with heating and ve during 1925 : Lumby Premium, £1 Sirocco Premium, £10 10s. ; Grenville I £5 5s. The winning of an award carrie a medal of the Institution. Full partic be obtained from the Institution, or seen at this office.

Other Competitions.

Other competitions still open include lowing (the dates given are, first the se date, and second the issue of *The Bu* which full particulars were given) :— Hall (May 1). Manchester Art Galle 28; Aug. 22). Jugo-Slav Landscape (Nov. 7). Argentine Institute for t (Dec. 31, 1925; Nov. 28). Valletta (June 30, 1925; Dec. 5).

New Bridge for Rotherham.

The Rotherham County Borough recently decided to build a new bridge River Don at Rotherham at a cost of half of which will be borne by the of Transport. The present fifteenth bridge has been scheduled as an monument.

Some American Shop Fronts.

A MEETING of the Royal Institute of British Architects was held at 9, Conduit-street, W.1, on Monday last, Mr. J. A. Gotch, President, presiding.

Obituary.

The HON. SECRETARY (Mr. A. Keen) announced the death of Mr. John Slater, Associate 1879, Fellow 1881, Vice-President 1900–1904; Mr. A. W. Sheppard, Associate 1894, Fellow 1924, Hon. Auditor 1907 to 1909, 1915 to 1917, and 1921 to 1923, and a Member of the Science Standing Committee for Session 1923–1924; Mr. H. W. Lockton, Licentiate 1911.

It was decided that a message of sympathy and condolence be conveyed to the relatives.

SHOP FRONTS AND THEIR TREATMENT.

In the course of a lecture on this subject, Mr. A. J. Davis said the subject he was dealing with was one of considerable interest both to shop owners and their architects. The commercial and æsthetic developments which had taken place during recent years in the treatment of the shop-front clearly showed that after a period of neglect this problem was at last receiving the attention it deserved, and that the merchant was no longer content to leave the decorative treatment of his window to the tender mercies of the contractor and fitter. The modern shop-front was essentially a problem requiring artistic consideration. It was one which appeared frequently in most architects' practices, and its many aspects presented opportunities where skill and taste could be displayed to the advantage of the client, and to the embellishment of the street in which his premises were situated. It had become more and more recognised that an appropriate shop-front was in itself a commercial asset of no small value, in the same way as the beauty of a picture was enhanced when presented in a well-designed frame.

After describing the shops of ancient times, the lecturer said very limited progress was to be recorded in the thirteenth and fourteenth centuries, but advance might be noted in the early part of the fifteenth century, when they found that shops had their fronts so made that the lower half of the boarding which secured the opening could be let down and supported on legs, forming a platform about 3 ft. high on which goods were exposed for sale. The upper part, being hinged at the top, could be lifted up to give protection from rain and sun. A few instances remained of shops of the fifteenth century, the most perfect being that at Butcher-row, Shrewsbury. Each business was distinguished by a hanging street sign, a few of which were still in common use; two well-known examples being the barber's pole and basin, and the pawnbroker's three balls, the latter being derived from the shield of the Medici family, whose principal business was money-changing.

The shop-fronts of the nineteenth century were lighter and more refined than the sturdy and perhaps more architectural examples of the seventeenth and eighteenth centuries. Semi-circular fanlights decorated with radiating and curved glazing bars were commonly seen. Cornices and pilasters were very much alike in the manner of their use, the enrichments being plentifully varied. Most of the fronts of this period were well proportioned, due recognition having been given to the limited uses of material, the latter being usually wood. A classic influence upon the nature of the moulding and details was quite pronounced. Thin pilasters, fluted or panelled, and usually without capitals, were frequently introduced. The stall boards were rather high, panelled in wood, and often additionally protected by some excellent wrought iron or lead work. Bead butt or bead flush doors were greatly in favour, and sliding shutters used in preference to the flap arrangement of previous centuries. Among many old fronts that were interesting, perhaps none were more suggestive of refinement, and of that perfection of form and detail which were all essentials of a precise architectural effectiveness, than the shop-front of Messrs. Fribourg & Treyer in the north end of the Haymarket. The successful simplicity of the doors and fanlights and the details of the frieze and cornice were delightful. It was originally designed for the business of a tobacco merchant, and was still used as such; its date was about 1770. Another interesting shop-front was that of Birch's in Cornhill, one of the oldest existing fronts in the City, and built probably during the reign of George I. The ornament was of considerable merit, and the whole treatment reminded one of the picturesque London of a former age. Another simple Georgian front was that of Boxford, Suffolk, probably of mid-eighteenth century date. Its slender proportions were rather reminiscent of American Colonial work. A motif of that period particularly admired was the shallow curved bay window. It occurred often, and always to good effect.

In the early nineteenth century they saw examples illustrating a further step in the development of shop-front design—the architect adopting a treatment incorporating some classic details in the manner of Sir John Soane. The shop in Artillery-lane was an example showing a clever and original adaptation of classic form and details. The architectural treatment of the two doorways was distinctive.

As to plate glass, the shop owner counted the inches with as much eagerness as a farmer did his acres of land and thought they were productive in much the same manner. His rent was regulated to a very large extent by the length of his frontage, and he naturally thought it was to his advantage to utilise every possible inch of it for display of his goods. He therefore voted every pier which supported the upper part of the building an obstruction and a nuisance; every pillar must be as thin as possible and be put as far as it could out of sight, and the whole superstructure, as far as appearances go, must hang unsupported in mid-air. They believed the main reason why they had so few art shop-fronts was to be found in the m contrarieties which had to be reconciled them. The shopkeeper required the ga chasm and his plate glass. He was fi convinced that the open space served his pose best, and when he yielded a little on point he insisted on vulgar gilt letterings as much gaudy ornament as possible attract customers. Thus their street ar tecture progressed far too slowly, and w they did not find a dull uniformity they frequently afflicted with a medley of in gruous and inartistic conceptions worthy of a nation of shopkeepers. The precise p in fact, wherein the salesman needed ed tion was that good architecture forme feature of attractiveness in itself. A front composed of nothing but plate glass like a picture without a frame, and the art displayed by the tradesman without the cessories of appropriate building decorat lost half their power of attracting custon The passion for enormous sheets of plate g had done more perhaps to prevent the crea of good designs than anything else. utmost the architect could attempt was introduction of sash bars in brass, mahog or some coloured material, and these he called upon to keep as thin as possible in o that the valuable glass sheets might dis their full dimensions. These instructi while embarrassing to the designer, seeme them entirely unnecessary and useless i multitude of businesses.

It might generally be stated that la open spaces of window created an effec cheapness upon the passer-by, which was always the impression which the partic business wished to convey. The sm window, well-proportioned and prop framed, had an air of exclusiveness very ne sary to the firm that wished to please a s *clientèle*. The perfume shop of Me " Atkinson " in Bond-street provided a not example of what the architect could do in respect. Liberty's new building in Ar place was another illustration on a la scale that a much greater appeal was mad not exposing everything the shop contai but rather hinting at the contents by a nun of separate and uncrowded window comp tions, was a psychological fact that no would deny. On the other hand, the shop the sale of numerous articles of a cheap na designed to attract the pennies of the ca pedestrian was a problem requiring a different solution. It was here that the p glass front had its merits.

Architecturally there were several princi which might be applied to counteract the e of undue weight upon the plate-glass s front. An excellent solution was afforded setting back the window from the gen

Messrs. Morny's Shop-Front in Regent-street.
MESSRS. MEWES & DAVIS, FF.R.I.B.A., Architects.

sage. While admitting the loss of four or feet of valuable site, the advantages to business were obvious; the public were y invited to come within the line of the ing itself; they were in a position where had leisure to examine the display with- ear of jostling by passing crowds. Messrs. & Sons' store in Tottenham Court-road one of the few places in which this plan been adopted. The use of the deep, flat trave or frame as a surround enhanced nously the value of the window as a place ain to expose fine goods. A frame had dvantage of cutting off discordant sur- lings, and immediately gave the window er that opportunity to compose his wares was so necessary to accentuate their and add to their effectiveness. The nctive simplicity of Liberty's shop-front e Boulevards des Italiens, Paris, was ner interpretation of the same principle. e plain surfaces of veined marble relieved a coat of arms, the company's name and lad ornament in bronze, formed an ad- rle frame for the rich silks displayed n. The architecture did not clash with ares exhibited, and the flat surface treat- permitted a very shallow recessing of the , so that the best possible light was ntted.

hen it was desired to treat a shop-front single unit the full effectiveness would tained only when the design was kept enough to be embraced by the angle ion at one time. This applied, of course, ntages of small dimensions. The use of r, not only in the exterior surround of indow but also as a background for the , was one that should make an increas- ppeal to the designer. With regard to ial lighting, the general tendency was ds a softly-toned light of sufficient quan- either evenly distributed or concentrated ticles of outstanding interest. Whatever was required outside the shop should be ated as to be in keeping with the design. ior lighting was falling into disfavour, he powerful arc lamps of twenty years ad practically disappeared. All that was necessary was that the name of the keeper should be sufficiently apparent, and s now becoming the custom to place an nated hanging sign within the window In fact, the shop-front, in addition to a show window, was becoming one of the s of modern salesmanship, and was itself ften used as a means of publicity. The ng practice of illuminating the display hours after the premises were closed stuted an advertisement of fundamental tance. The appearance of the goods yed was greatly enhanced by cleverly con- and well-placed artificial illumination, many customers were no doubt attracted s means. Particularly was this the case ard to shops which specialised in feminine odities, and in this connection it might ntioned that light and colour had the rresistible fascination for women as the had for the moth.

ther modern innovation was the use of ighting which created unusual contrasts ht and shade. In the interests of pub- this was a very effective method of ily introducing the building itself to the notice. An example of this could be n Mr. Curtis Green's Wolseley Build- n Piccadilly, and at "Selfridge's," ol-street. While on the subject of pub- it was perhaps worth while to mention mewhat objectionable scintillating signs were at the moment enjoying a tre- us popularity, and had even been d for the fascia of shop-fronts. Per- the least offensive of modern electric was the "Neon tube," the colour and ction of which would no doubt be modi- time. Mercury vapour tubes were nally to be seen, but they gave a effect to the complexion, and women ere aware of this generally contrived to he shops which used them. The use of e lettering had recently been acknow- as a commercial necessity, and as such ue of expert advice was recognised. The

A Shop Front in the Rue de la Paix. Paris.

well-known incised gilt letters were gradually being replaced by characters of careful design and proportion, properly spaced and harmonising with the general decorative treatment.

With regard to the construction of shop-fronts, it might be remarked that bent windows were no longer the fashion. Not only were they expensive, but they produced distorted reflections which were very objectionable, especially where concave glass was used. Much thought had been given to the question of avoiding condensation upon the inside of the shop window. Theoretically the problem was quite easy of solution, for it is only necessary to keep the temperature equal on both sides of the glass. To do this, however, the external air must be allowed to circulate freely, and the difficulty of admitting it evenly, at the same time excluding dust, was one that was not easily overcome. The most effective method yet evolved was to provide a film of hot air on the inside surface of the glass by means of a coil of heating pipes concealed in the window board extending across the whole front and to a depth of about 12 in. This system had the effect of drying the air locally and was very efficient in preventing condensation. The level of shop floors should be made about the same as that of the pavement, thus making it easy for prospective customers to enter the merchants' places of business. This might seem to be but a detail, yet it was important, for the buying public, to quite an extent, followed the line of least resistance, so that all steps or obstacles which might deter people from entering should be omitted. The heights of window-floors should be made to conform to the kind of goods displayed. Furniture should be shown at nearly pavement level, while rings and articles of jewellery should be presented in about the position a person would naturally wear them. In fact, it might be adopted as a maxim that merchandise, to be displayed to the best advantage, must be shown as nearly as possible in the position in which it is intended to be used. It was gratifying to note that this interesting branch of civic architecture was receiving the consideration it deserved; and that those engaged in merchandise were alive to the importance of a problem so long neglected. In conclusion, he would quote Mr. Marshal Field, an American authority on the subject, who said that "Goods well displayed are half sold."

Discussion.

CAPTAIN IVOR STEWART-LIBERTY, in moving a vote of thanks to Mr. Davis, said the shop window question was an extremely difficult one, As an explanation of his own attitude towards Renaissance building, he remembered the time when famous business premises in London had a personality of their own: to-day it was sometimes difficult to know in which particular shop one was in. It might help those who were rebuilding in the future to remember that temporary shop windows were extremely valuable, even if they had to be reached across "A Bridge of Sighs." The secret was that they had a real frame, and the back of the window was close to the glass. With regard to the addition of colour to the frame shopkeepers had to be extremely careful. The materials they showed were constantly changing; they had to play for safety and go in for dark colours.

MR. A. S. GAYE, in seconding the vote of thanks, said Mr. Davis had chosen one of the most difficult problems modern architects had to face. When an architect had to design a shop front it was, perhaps, difficult for him to reconcile his duty to his art and his duty to his client. The average shopkeeper did not care how his window looked so long as it attracted attention. It would be better if shopkeepers took the advice of their architects instead of following their own ideas.

MR. P. J. WALDRAM said he made a plea for the lighting engineer and the architect to co-operate at the earliest possible stage of the design. The proportion of a shop front meant everything to an engineer, and if he were given one already proportioned efficient lighting became almost impossible. In many of the shops in Bond-street it was impossible in summer time to see anything owing to the reflections; both from the spectator and the other side of the road. It could be overcome by a shallow shop front, which would also make it easier for the lighting engineer.

PROFESSOR A. E. RICHARDSON said they had heard a great deal about the small shop fronts of an intimate character: he would take them to the rebuilding of New Oxford-street which would take place shortly. It seemed to him that following the question and the idea of zoning there should be an opportunity to zone the drapery interest. This street could be rebuilt on big lines. What would they say to having three ranges of shops; one on the level with the pavement; another on the first floor; and the third at the top of the building. The idea was not extravagant; it had been carried out in idea in the sixteenth century at Florence. Various establishments might be designed as separate buildings, on the Paris model, and connected with flying bridges across the streets. It would only apply to certain streets, which would be zoned. Some of their members had prepared designs for this street. They must enter upon schemes of an imaginative and comprehensive character.

MR. E. S. HALL, speaking of hanging signs, said they had been most attractive in the past, and they still might lend interest and colour to their streets.

Messrs. A. Braden, G. H. Jenkins, John Murray, H. V. Lanchester, and A. H. Moberley also took part in the discussion.

Mr. A. T. Davies briefly responded to the vote of thanks.

THE ROYAL ACADEMY STUDENTS' WORK

SIR ASTON WEBB was to have distributed the prizes to the students of the Royal Academy School at Burlington House, on December 10, but owing to his unavoidable absence his place was taken by Sir Frank Short, R.A., who read a brief communication from the President.

In the course of his letter Sir Aston said it was easy, of course, to criticise and find fault, especially when students' work was under review, but he had been round the galleries with a painter member of the Academy who was a keen critic, and also very sympathetic with students' work; and they thought they found a general tendency throughout to work on certain lines, leaving the later Italian and Reynolds' schools for the early Italian. They found much beauty of form and construction and finish in the life drawings and paintings, and a greatly improved idea of composition as shown in their studies for the decoration of an apsidal dome, with the same tendency towards early Italian design strongly marked.

It was no doubt a great thing to have tradition to work upon, to which, however, they must add a certain adventurous spirit of their own; for perfect reproduction only, even of a Michelangelo, would not avail. It was sympathy and imagination that made the artist—sympathy with tradition, and imagination in their own personality as artists. Let them cultivate both, and they might leave behind them something worth doing—and after all, doing was the principal thing. It was for the older ones to see visions of what might have been, and for the younger men and women to dream dreams of what might be and what would be if they made up their minds it should be. Perhaps they would say they did not care for dreams. Very well; but if so, let them not despise those who did. Both were required in the world—the dreamer and the practical man. Sometimes, but very rarely, they were both found in one man, and then we had produced the rarest of all products, a genius like Joshua Reynolds or Christopher Wren. Let them determine to hold high the standard of their art so that they could stand before the world unashamed.

Prize List.

Design in Monochrome for a Figure Picture (Penelope and the Suitors)—Armitage Prizes 1st (£30) and Silver medal, not awarded; 2nd Prize (£10) and Bronze Medal, Alan Blyth.

Landscape Painting (A Farm)—Creswick Prize (25) and Silver Medal, Eve Cynthia Ruth Garnett.

Design for the Decoration of a Portion of a Public Building (a Figure-Subject from the Bible for the Decoration of the vault of a semi-circular Apse at the east end of a Church)—Landseer Prizes, 1st (£30) and Silver Medal, Alan Blyth; 2nd (£10) and Bronze Medal, Olive Grace Bourne.

Set of Four Drawings of a Figure from the Life: 1st Prize (£10) and Silver Medal, Frank Edward Slater; 2nd Prize (£5) and Bronze Medal, Woltera Mary Barclay-Smith; Best Finished Drawing of a Head in any Set—Prize (£5), Woltera Mary Barclay-Smith.

Two Paintings of a Figure from the Life—1st Prize (£10) and Silver Medal, Daryll Sullivan; 2nd Prize, Bronze Medal, Jessie Mary Margaret Hodge.

Cartoon of a Draped Figure (Grief: A Crouching Figure)—Landseer Prize (£2 Silver Medal, Edward Dennis Earle.

Portrait Study of a Lady in Evening showing Arms and Hands—Arthur Hacke (£30) and Silver Medal, Margaret Hill Scla

Drawing from the Antique—Prize (£ Silver Medal, Marjorie Gossling.

Model of a Design of a Subject con with Architecture (A Memorial Tomb Arched Recess)— Edward Stott Prizes, 1s and Silver Medal, Frank Pentland Chan 2nd (£20) and Bronze Medal, Hubert I MacGeogh Gilbert.

Two Models of a Bust from the Life—1s (£5) and Silver Medal, Alice Bertha T 2nd Prize, Bronze Medal, Una Rawnsley.

Model for a Medal or Coin (A Seal Industrial City)—Prize (£10) and Silver Eva Dorothy Allan.

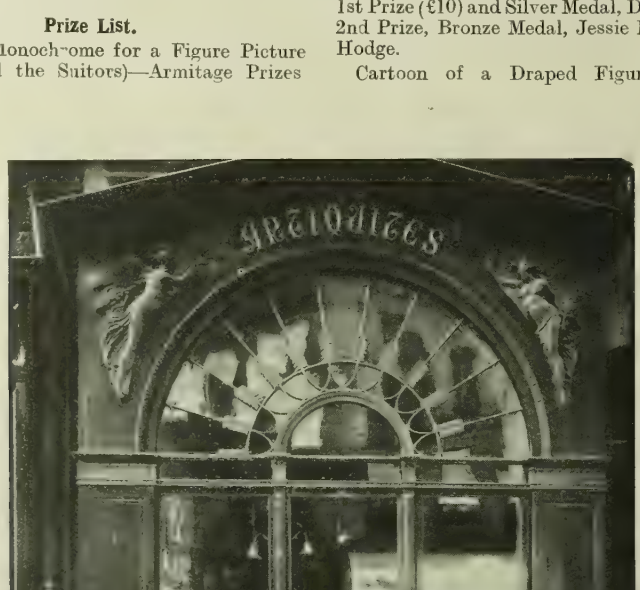
Set of Three Models of a Figure fro Life—Landseer Prizes, 1st (£30) and Medal, Eva Dorothy Allan; 2nd (£20 Bronze Medal, Lilian Everilda Birch.

Design in Architecture (A Municipa School and Picture Gallery)—Travelling St ship (England) (£60) tenable for one James Francis Mason.

Perspective Drawing in Outline (open Students) (The Courtyard of Burlington from the north-west corner)—Prize (£5 Silver Medal, Ronald Owen Vinc.

Set of Architectural Drawings (The Gate of York House, Buckingham-str 1st Prize (£10) and Silver Medal, Edwin H Horsley Williams; 2nd Prize, Bronze Herbert James Hall.

An Architectural Design (First Term St only)—1st Prize (£10) and Silver Medal, V John Brookhouse Prize; 2nd Prize (£ Bronze Medal, Edwin Herbert Horsley Wi (ineligible through having received the prize before).



An Architectural Design—Landseer (£20) and Silver Medal, Hubert Edwin Fu

Landseer Scholarships in Painting Sculpture, of £40 a year each, tenable f years, have been awarded in Painti Mabel Bowden and Doris M. Stacey Sculpture to Lilian E. Birch and Una Raw

There was no competition for the pri A Pencil Study of a Landscape Foregroun An Original Composition in Ornament (arc only). The prizes for Composition in and Painting of a Head from the Life, Lif were not awarded.

A Bond Street Shop Front.

THE BRIDGES OF LONDON

(December 12, Major Harry Barnes, .K.B.A., lectured before The London Society i ais subject. Sir Lynden Macassey, K.C., esided. In the course of his remarks Major ar s said London had 105 bridges, and of ie no fewer than 53, a majority, were not e water courses.

Aer giving details of the various bridges, e ecturer dealt with what he called the ste of the Bridges, and said it was a triple ie there was the battle of position, the tt of type, and the battle of style. The st nd the last furnished the hottest engage- en, but the second was not without some ur and fury. The battle of position began t seaward end of their river stretch. South to Tower Bridge they were out of the gi of bridges and into that of tunnels. ie two London County Council tunnels, ot rhithe and Blackwall, carried little more ar per cent. of the vehicular traffic across e ver, yet they were responsible for 50 per nt of the capital cost of cross river com- unations. There were, however, those who alnged the whole position of the advocates ore bridges. London, they ejaculated, is city and not a corridor. There was ne in the argument that appealed. He was f by-passes; he would like cities and wi not on main roads but pendants to them, kil of vermiform appendixes with no cor- ulit for the mere passer-by. For what vatage was there in bringing traffic through a wnor city if it could as conveniently go un it? As a general proposition he was epted to agree that bridges should not be ilto induce traffic but to relieve congestion. heter that disposed of the proposals to ildnew bridges or widen old ones between ndn Bridge and Westminster was another att and they might pass on to examine m

The were four of them known commonly as Pal's, the Temple, Waterloo and Charing oss Those who did not want St. Paul's idg found in the last argument for it the omist argument against it. Make the ssa through the City easier, they said, and y ould make it more difficult. If their ffic blocks now were whips they would ron as scorpions, and congestion such as erwas would be the result. St. Paul's idg moreover, raised a question unique on bridges, that of the stability of St. ul's Cathedral. They said threatened men ed ng, and it might be as true of churches. Id listened to conversations between inet engineers and architects that made n dubt if he should ever again see Wren's me ise over Ludgate Hill. It was difficult belive, however, that the City Fathers could caless of the fate of the greatest of the y clrches, and in face of the First Report of Eyal Fine Arts Commissioners, it was hai not too much to expect that before oceeing further with St. Paul's Bridge they uldake such steps as would genuinely allay e aprehensions that the report had aroused. ha been suggested that were St. Paul's de great high level bridge it would facilitate e aess of people both from north and south, the heart of the City.

He ould say with a sense of the greatest ponbility that the stability of St. Paul's theral was causing the greatest anxiety ong all those charged with the care of it, d if ney really wanted to save this supremely ion monument from disaster immediate ps t the public expense must be taken to ert .

Afte St. Paul's Bridge came the Temple dge It, too, had its sponsors who said St. ul's Bridge was not wanted, and Charing oss Bridge was too remote to be a rival. e Tmple Bridge would leave the Strand newere about Arundel-street about 400 yards ow Waterloo Bridge, linking up with the sterend of the Aldwych.

Wit regard to Waterloo Bridge, the present cockpit of engineers at variance, to pin or not to pin, that was the question—whether it was better to pile and grout or take arms against a sea of critics to end it. He was a little inclined to paraphrase the hapless Dane and say, "The Bridge is out of plumb, Oh! wretched spite that ever we were born to set it right." There were those whose devotion for the past was so great that they would treat every building a century old with the same reverent care that was bestowed on a Stilton cheese—scoop it out as much as they liked, but Oh! preserve the rind. They admonished them that they might take up the roadway and refill the core, underset the foundations, renew and replace as they liked where it was not seen, but if they removed a stone or laid a finger on anyone of the three dimensions, like Shylock, their lives should pay for it. To maintain a bridge, 42 ft. wide, in the very centre of London's Strand, loaded to 66 per cent. of its capacity, with its neighbour 105 ft. wide, only carrying 27 per cent. of the volume of traffic it could take! He confessed it made him think of Morley's dictum, that what came from the heart should go round by the head.

With regard to Charing Cross Bridge, what was the scheme? To cross the Thames on the line of the South-Western Bridge by a double decker bridge, electric trains on the lower level with a wide roadway above, along which would flow the traffic from north to south that now sought a congested outlet over Westminster Bridge. The roadway was to cross the Strand by a bridge finding its level somewhere by Nurse Cavell's Statue. So doing it would avoid creating another traffic block in the Strand, an essential part of any bridge scheme on the northern side of the Thames. It was not so clear where one got down to the level on the southern side, and he though something might be done to make this part of the scheme clear. Here they were against a bridge difficulty, particularly in the Thames valley, where they had one bank so much higher than the other. He did not know of any other points in the stretch of river with which they were concerning themselves where bridges were suggested, and if he must declare himself on these four, one that drew away from all the others in fulfilling the purpose for which a bridge across the Thames should be undertaken so as to make it the choice of choices, it was Charing Cross.

The battle was not over, however; when they had fixed on their position, there remained two issues at least to be contested. The first was this: What was to be their type of bridge? Was it to be a High Level or a Low Level bridge? Was their approach on the northern side to start from the embankment or from the Strand, or beyond that from Holborn itself or some near point to it?

How little they were guided in these things by reason, how much by convenience!

With regard to material the lecturer said he supposed bridges could be made of any material from bamboo to coke breeze, but he did not propose to invite them to consider so wide a range. He would narrow the issue to stone, steel and concrete. This was not to ignore the possibility and even beauty of brick as a bridge material. Brick was an admirable material, and if used with understanding was capable of producing most architectural effects, but it was not in the range of practical politics for a bridge on this river front. They were tied to a trinity of stone, steel and concrete, and the greatest of these was stone, which was unfortunate, for as far as he could see stone bridges which were really stone bridges were out of the question. Waterloo bridge was more than a hundred years old and London Bridge was within a lustre of its century (undoubtedly the two best designs on the river). London Bridge covering 782 ft. in five spans, Waterloo covering 1,240 ft. in nine spans. They were of stone with arches, and bridges could have no fairer chance than to be compounded of such elements.

When they talked of the bridges of London in the area to which they had confined themselves they were not talking of bridging one stream; they had not only the River Thames to cross, but at least two traffic rivers on each side of it, and it was that fact which drove him to the conclusion that if they were thinking of bridges and not of tunnels, the time had come when there was only one type of bridge that would meet the necessities of the case, the high-level type, that of all the positions in which it was possible there was no position to compare with that occupied by the present Charing Cross Bridge, and finally, that if they were to be equal to the occasion and it had been well said there was no other equality worth the name—they should not shrink from the task of setting in its place there a bridge that in a century's time would for those of that day be a proof that bridge building did not cease with Rennie, and that the capacity to satisfy through great monuments the needs and aspirations of a great city was not exhausted when the London County Council took the fate of London in its hands.

In proposing a vote of thanks to Major Barnes, Mr. W. R. Davidge said he was against two-decker bridges, and personally would regret to see two systems combined in a double-decker bridge; it would spoil the sweep of the river and not improve the bridge as a bridge. However, they must have means of crossing the river by railway, and railway communications must be taken into consideration. He was all in favour of a by-pass London.

At the conclusion of the proceedings Sir Lynden Macassey in expressing his appreciation of Major Barnes' paper, said a bridge at Charing Cross was really necessary, but the question of bridges was entirely one of finance. He would suggest that the whole question should not be a charge on the City, but on the whole of the London area: the question went to the root of the welfare of the whole Metropolis.

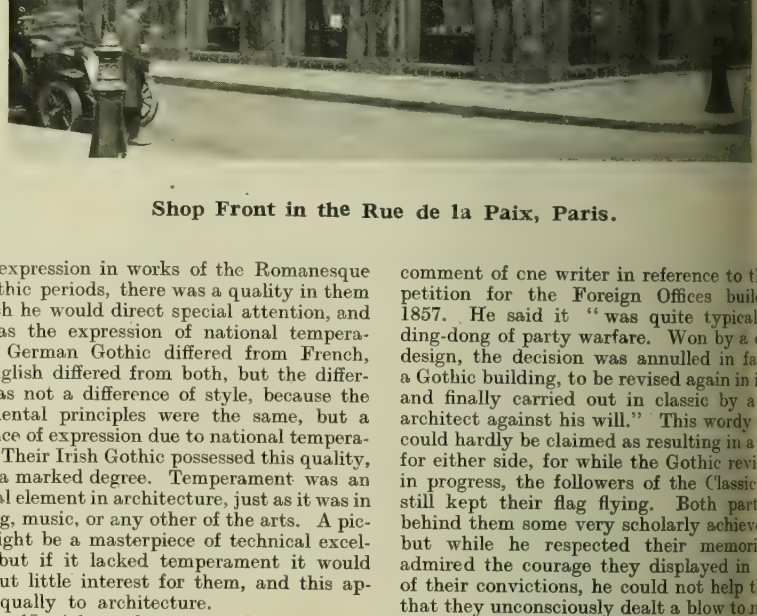
ARCHITECTURAL ASSOCIATION OF IRELAND

MR. L. F. GIRON, M.R.I.A.I., recently gave his inaugural address as President for the session 1924-5, before the Architectural Association of Ireland. In the course of his remarks, the President said they were assembled in their new home for the first time, and their entry into those premises marked the opening of a new chapter in the history of the Association.

The President then dealt with the subject of "Nationality in Architecture," and said that architecture had been very aptly described as the printing press of all the ages which gave a history of the state of society in which it was erected. The truth of this definition at once became apparent upon looking back over the past. The works of the Greek, Roman, Romanesque, Gothic and Renaissance periods in architecture became so many chapters in the world's history, each unfolding its story of relentless power, of conquest, of defeat, or piety, and so forth, and giving an invaluable guide to the life and habits of the people. They noticed that each of these chapters was clearly marked by a change in the style of architecture. This change was not abrupt, but was of gradual growth, and up to the time of the Renaissance was the natural outcome of advance in the knowledge of construction.



The Greeks adhered rigidly to the trabeated system and evolved and perfected what they now knew as the orders. The Romans received their early lessons in building from the Etruscans, but made little progress in architecture until they came in contact with Greece. After the conquest of Greece, they adopted the use of the orders, but they changed their character somewhat, and also the manner of employment. They also developed the construction of the vault and the dome, and inaugurated the use of concrete.

What they called the Romanesque style was the result of an awakening after a period of slumber. Early examples showed signs of having been inspired by Roman work, but after a time a distinctive character became apparent, varying in each of the countries in which the style was practised.

Constructive necessity and inventive genius led to the development of the Gothic style which substituted the laws of elasticity and equilibrium for those of inert stability, and in this style they had the arcuated system brought to perfection.

They now came to the first break in the orderly evolution of style out of structural necessity. The fashion for studying ancient Greek and Latin authors, the existence of classical remains, which were a fruitful and attractive source of inspiration, and the inherited classical tradition, all contributed to the Renaissance movement in Italy, which was really a return to ancient forms in architecture. Italy was, at this time, the centre of European culture, and as a consequence the movement spread rapidly throughout the Continent. This period was of peculiar interest, because the architect never enjoyed his rightful position as an individual artist until the time of the Renaissance. The age of collective art had passed, and in the works of this period they found the individual expression of the artist. While they could not trace individual expression in works of the Romanesque and Gothic periods, there was a quality in them to which he would direct special attention, and that was the expression of national temperament. German Gothic differed from French, and English differed from both, but the difference was not a difference of style, because the fundamental principles were the same, but a difference of expression due to national temperament. Their Irish Gothic possessed this quality, too, in a marked degree. Temperament was an essential element in architecture, just as it was in painting, music, or any other of the arts. A picture might be a masterpiece of technical excellence, but if it lacked temperament it would have but little interest for them, and this applied equally to architecture.

Since the eighteenth century they appeared to have lost much of their power of national expression, and this he thought was probably due to the various revivals of the nineteenth century, which broke down development on traditional lines. The publication of Stuart and Revett's "Antiquities of Athens," P Adam's "Spalato," Inwood's "Erechth and other works, brought about in Engla increased interest in classic work, but a same time a lot of slavish copying; while in the nineteenth century, the publicati works on Gothic, by Batty Langley, Rick Brandon, and others, created a new in in Gothic work. About the 'fifties of th century, the battle of the styles was fiercely, Ruskin, Parker, Sharpe, and defending Gothic against Cockrell, Dona and his following, and the effect upon the of public buildings might be gauged

Shop Front in the Rue de la Paix, Paris.

comment of one writer in reference to the petition for the Foreign Offices buildi 1857. He said it "was quite typical d ding-dong of party warfare. Won by a cla design, the decision was annulled in favo a Gothic building, to be revised again in its and finally carried out in classic by a G architect against his will." This wordy wa could hardly be claimed as resulting in a vi for either side, for while the Gothic reviva in progress, the followers of the Classic S still kept their flag flying. Both partie behind them some very scholarly achieven but while he respected their memories admired the courage they displayed in de of their convictions, he could not help thi that they unconsciously dealt a blow to nat architecture by modelling designs on foreign w

Now the question was how were the restore this character which was wantin much of their modern work? Well, he bel that it could only be done by the establish of a central live school of thought wh their embryo architects would be traine think as Irishmen all the time, and where would be taught to develop their art on t tional lines and to study and learn the p application and use of the native materials which their country abounded. Why was F so far ahead in the matter of national arch ture? It was simply because for the pas hundred years her sons had enjoyed the ad tages of a State school, whose curriculum framed on sound principles calculated to the student with that wealth of knowledge culture which was necessary to the full ex sion of national ideals and aspirations in tecture.

See the wonderful progress in America, v architectural education was introduced on the middle of the last century. In England a number of schools were now established sound footing, and were tending to produ more stable line of thought in matters a tectural.

Much had been said and written in r years on the subject of establishing a C Culture in Ireland, and efforts were now made towards that end. As culture four highest expression in the arts, they r express the hope that architecture—the M of the Arts—would not be overlooked ir scheme which might be formulated.

"Devonshire Court," Mayfair.

is block of buildings is to be erected on a on of the Devonshire House Estate, and occupy an area of approximately 44,000 . From the block plan, it will be noted that buildings occupy a position with a long age facing south on the extension of ton-street, and a similarly long frontage to eley-street—which is to be widened and form a much-needed street improvement. ite also adjoins Lansdowne House Gardens. e scheme is for a block of buildings, com-ng a series of shops facing Berkeley-street Stratton-street, with flats above, and, as ed, there will be large open courts behind main frontages, whilst down a few steps the street level, and accessible from all lats and from entrances in Berkeley-street Stratton-street, there will be a building ying a space of approximately 140 ft. × , to be used as a restaurant.

e perspective is from the drawing made by T. Hansford White, A.R.I.B.A., of the tect's preliminary study for the building. ny special problems are involved in this ne, and it is proposed to employ electricity ghting and heating, &c., and to produce with every convenience for easy working; ugh each flat will be self-contained, access e provided to the restaurant on the lower nd floor.

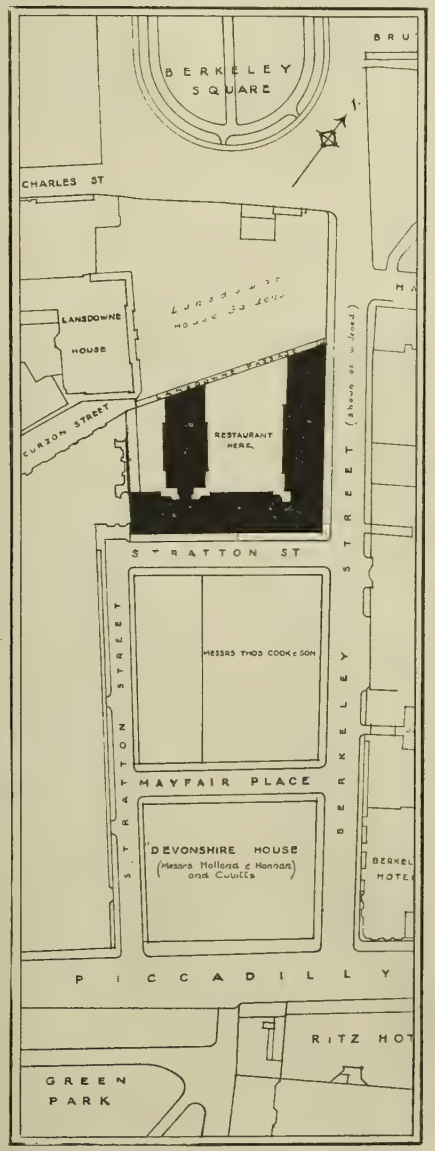
e building will be erected by Messrs. ster, Ltd., London, W. 12, who are at nt engaged in excavating on the site, and will carry out the work from the designs . W. Henry White, F.R.I.B.A., of Caven-place, London, W. 1.

Byron House.

ron House is situated at Nos. 7-9, St. s's-street, S.W.1, in the heart of "Club-" It has a frontage of 61 ft. to St. James's-, and extends from that street to Crown-, where there are two entrances. There ight stories, with a total of 38,000 super-ft. of floor space. The Renaissance eleva-to St. James's-street is in Portland stone. esisting materials are used throughout; are of oak or other hardwood blocks; eating is by low-pressure hot water. The actors are Messrs. Edcaster, Ltd., of erd's Bush, W. 17.

W. Henry White, F.R.I.B.A., is the ect. The perspective drawing is by Mr. ansford White, A.R.I.B.A.

n Entrance, P. & O. Banking Corporation, St. Mary Axe, E.C.



s drawing shows the main entrance to the ffices of the P. & O. Banking Corporation, corner of Leadenhall-street and St. Mary-axe. The materials used are granite to the plinth, with Portland stone above. The general contractors for the work are Messrs. Trollope & Colls, Ltd., and the following sub-contractors were also employed: Heating, Jas. Gray, Ltd.; windows, W. Richardson & Co.; electric light, Electrical Installations, Ltd.; marble work, Burke & Co., and Bellman, Ivey & Carter; granite work, Messrs. Brookes; asphalte, Faldo & Co.; plaster decoration, G. Jackson & Co.; bronze entrance doors, Birmingham Guild, Ltd.; hollow block floors, H. W. Cullum & Co.; lifts, Waygood-Otis, Ltd. The stone enrichments were modelled and carved by Mr. P. G. Bentham, of Stamford Bridge Studios. Plumbing and sanitary work is by Matthew Hall & Co.

The whole of the work has been designed and carried out under the supervision of Mr. Stanley Hamp, F.R.I.B.A. (Collcutt & Hamp); and the perspective drawing is by Mr. Kenneth Anns.

Newcastle High School.

The war memorial at Newcastle High School, Staffs, is now finished; the work has consisted of a panelled dado, gallery, and organ at one end of the hall, a dais at the other end, and special furniture. The whole of the work is executed in wainscot oak left clean from the tool. The contractors for the work were Messrs. Foster & Dicksee, Ltd., of London and Rugby; the carver was Mr. Antony Smith, of Leicester; and the necessary alterations to the heating were carried out by Messrs. Haden, of Smethwick. The organ was built by Messrs. Hill & Son. Norman & Beard, of London and Norwich.

The architect is Mr. W. T. Loveday, A.R.I.B.A., of Rugby

"Devonshire Court," Berkeley-st., W.
MR. W. HENRY WHITE, F.R.I.B.A., Architect.

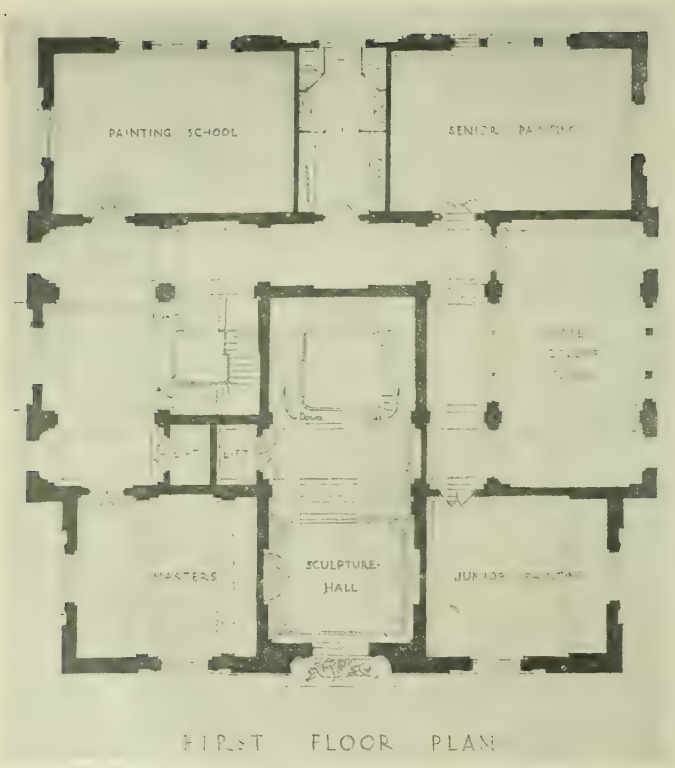
New Premises, Portland-place.

The contract for this house was signed over twelve months ago, but there has been unusual delay, and the house is only about half up. Advantage was taken of the ground being excavated to place the dining-room on the lower ground floor, with kitchen near it. The drawing-room is thus on the ground floor level, and the principal bedrooms on the first floor—a new thing for a town residence. The upper floors are planned to special instructions. A garage is built at the back and the space between is to have a garden, approached through French windows from the dining-room, outside which is a small stone terrace. The front elevation is faced with Portland stone. The site is leased from the Howard de Walden estate. The architect is Mr. G. H. Wenyon, F.S.Arc.

Horton Priory.

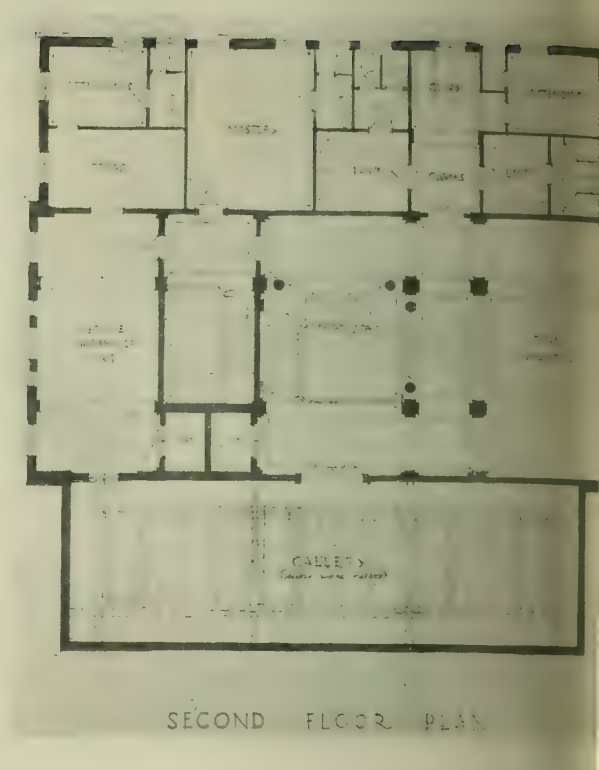
The old Cluniac Priory has been slightly altered and considerably added to by Mr. George Hornblower, F.R.I.B.A., and forms the residence illustrated in this issue. The work of adaptation was fully described in our issue for March 23, 1923, when other illustrations and plans were given.

R.A. Schools Students' Work.



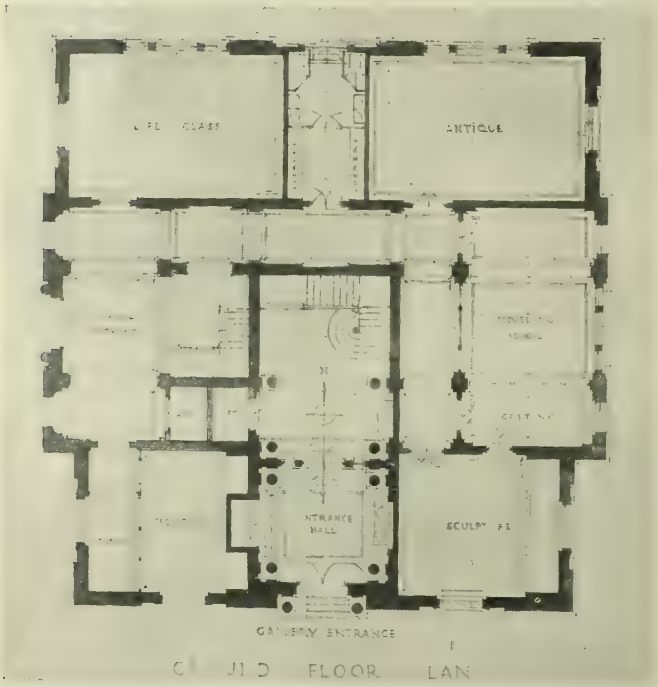
A list of prize-winners at the Royal Academy Schools is given on page 970. This week we illustrate a design for "A Municipal Art School and Picture Gallery, by Mr. J. F. Mason, awarded the R.A. Schools' Travelling Studentship (£60). The conditions required a simple and dignified building on an island site, 80 ft. square, in which to exhibit the municipal art treasures, with a picture gallery on the top floor, reached by lift and the main staircase, and an art school with a stated accommodation of classrooms, &c., to be entered from the side street.

The National Gallery.



The portrait of Vincenzo Morosini, by Tintoretto, has now been hung in Room VII at Trafalgar-square, among the other examples of the sixteenth-century Venetian School. It will be remembered that this portrait was presented to the Gallery by the National Art Collections Fund in commemoration of its coming of age, and of the National Gallery Centenary. The pictures of the French School in Room XI have been rearranged; the latest addition being a spirited portrait of a young French gentleman, by Louis Tocqué, purchased from Mr. G. S. Sedgwick, out of the Temple West Fund. In the vestibule is placed a characteristic seapiece by Charles Brooking (1723–59), the first considerable English painter of marine subjects. The picture has been presented to the Gallery by Miss Tupper.

Middlesex Hospital.



At a recent meeting of the Court of Governors of Middlesex Hospital, held in the Board Room of the Hospital, an important letter was read from Prince Arthur of Connaught. His Royal Highness, after describing the serious state of the old hospital buildings and the temporary measures taken to strengthen them, stated that he accepted the view of the experts that rebuilding was necessary, and the decision to rebuild the old hospital buildings at an estimated cost of £500,000 was approved by the Court. The letter further stated that the President of the Royal Institute of British Architects was called in consultation, whose reasoned opinion pointed, without qualification, to a complete rebuilding scheme, and, after submitting his report to the King's Fund, the Board decided to seek sanction to the adoption of that policy.

BRIDGE DESIGN

n his tenth Town Planning lecture at mingham University on this subject, Mr. liam Haywood, F.R.I.B.A., said the general racter of bridge design should be suited to environment. In the presence of great ural effects, as in the bridged intervals of a d through mountains, it should be bold, ple, and subordinate. Across vast cuttings, h cliffs of great size, an appropriate design ght be found—as at Clifton—in the magnifi- t stride of a cambered roadway of slight ckness between pyramidal abutments of ne.

or the Clifton problem—so far as situation concerned—might be treated as the Romans dged the valley of the Gard; with an amazing aphony of arches, in which the governing pose, the carrying of a stone-built channel at great height, was logically and superbly ieved. In this design there was harmony of e with the rugged valley; an effect of vast ngth applied to trifling labour; and there a better scale factor than was possible with suspension principle; yet the spirituelle nner of Clifton was at least equal in its eal to the terrestrial grandeur of the Pont du d.

reat estuaries, with relatively low land sses, provided conditions favourable to phasis in bridge design. The Firth of Forth such an estuary; and the Forth Bridge was, most respects, a successful design for the ation. The monotony of the landscape was best opposed, and the situation invited ominant design.

n undulating country, a road bridge and the nging rise of its approaches might rank in ortance with the lesser land swells. Easy ps and low parapets rising suavely over a crown were the most necessary elements of oper treatment for this situation. The type ridge with which they were most familiar that which linked two sections of a town ss a river. It was usually built with as few s as possible, and its arch-lines were either tical or segmental. Ammanati's Pontadella ita at Florence, *circa* 1566, a most beautiful ge of this character, was one of the first in ch the new elliptical form was used. The cutwaters and curves of the arches and pets were happily related to their architec- l environment. This type and its deriva- s were to-day the normal for moderately e rivers. Many of the Parisian bridges were is character, and the Pont Alexandre, with ingle span of steel, was a development of the e idea.

The more intimately bridges were associated with buildings, and especially with buildings of collegiate or civic importance, the more properly might they make use of details common to buildings. Balustrades, for example, seldom looked well except in the vicinity of appropriate buildings, or the architectural gardening which often formed part of their *entourage*. The delightful bridge at Clare College, Cambridge, built 1638 was a case in point.

Colour was also an important factor in bridge design; and particularly in the design of modern composite structures. All the older or pre-steel bridges were uniform in colour because built throughout of the same material; but where several materials were employed, a comprehensive effect was more difficult, and was often thoughtlessly ignored. In Southwark Bridge, for instance, the granite piers were of a whitish grey, and the metal arch-spans nearly black. The new Southwark Bridge had the same apparent lack of cohesion; and as steelwork must always be subject to periodical painting for its preservation, and this detail was usually outside the designer's control once a contract was completed, bridges of this type were liable to lose unity of effect by the injudicious use of inappropriate colour values. It was one of the strongest claims for the superiority in æsthetic quality of ferro-concrete over steel in bridge building that it was not subject to this disability.

ROYAL INSTITUTE OF BRITISH ARCHITECTS

We take the following notes from the Minutes of the Council meeting, held on December 1:—

Registration of Probationers:—On the recommendation of the Board of Architectural Education the Council decided to accept the Senior Certificate Examination of the Ministry of Education, Northern Ireland, in support of applications for registration as Probationer R.I.B.A., provided the certificate covers the required subjects.

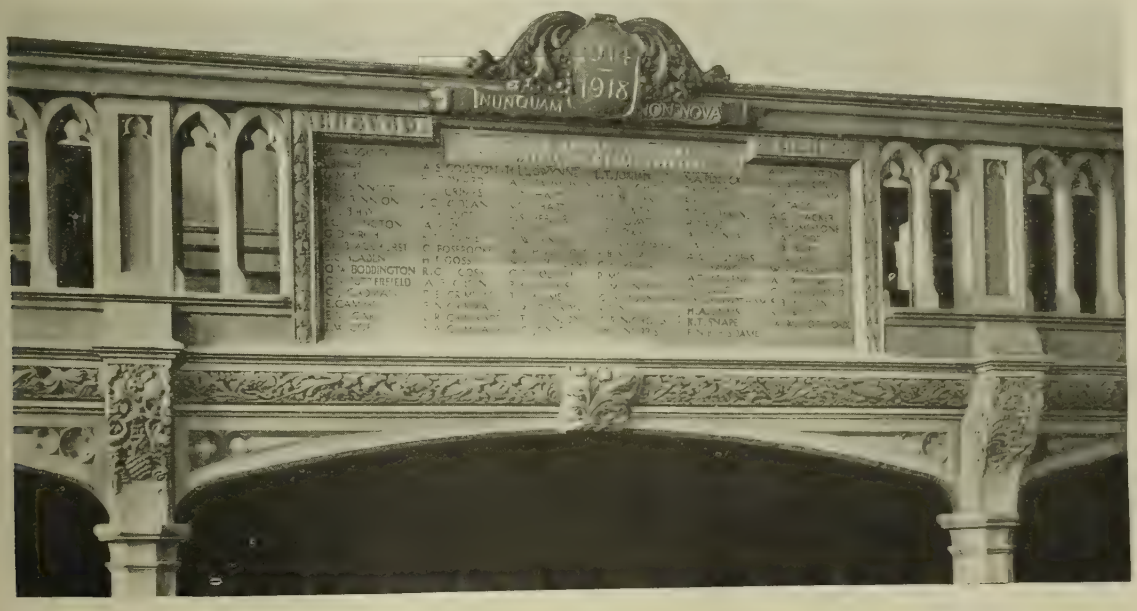
Godwin Bursary and Wimperis Bequest:—On the recommendation of the Board of Architectural Education, the Council approved the Memoirs and Sketches submitted by Mr. W. T. Benslyn, A.R.I.B.A., Godwin Bursar, 1923.

Illegal Use of the R.I.B.A. affix:—The Council were informed of two cases in which the R.I.B.A. affix had been illegally employed by non-members of the R.I.B.A., and it was decided to take strong action in the matter.

Reinstatement:—Major L. M. Wells-Bladen was reinstated as a Licentiate of the R.I.B.A.

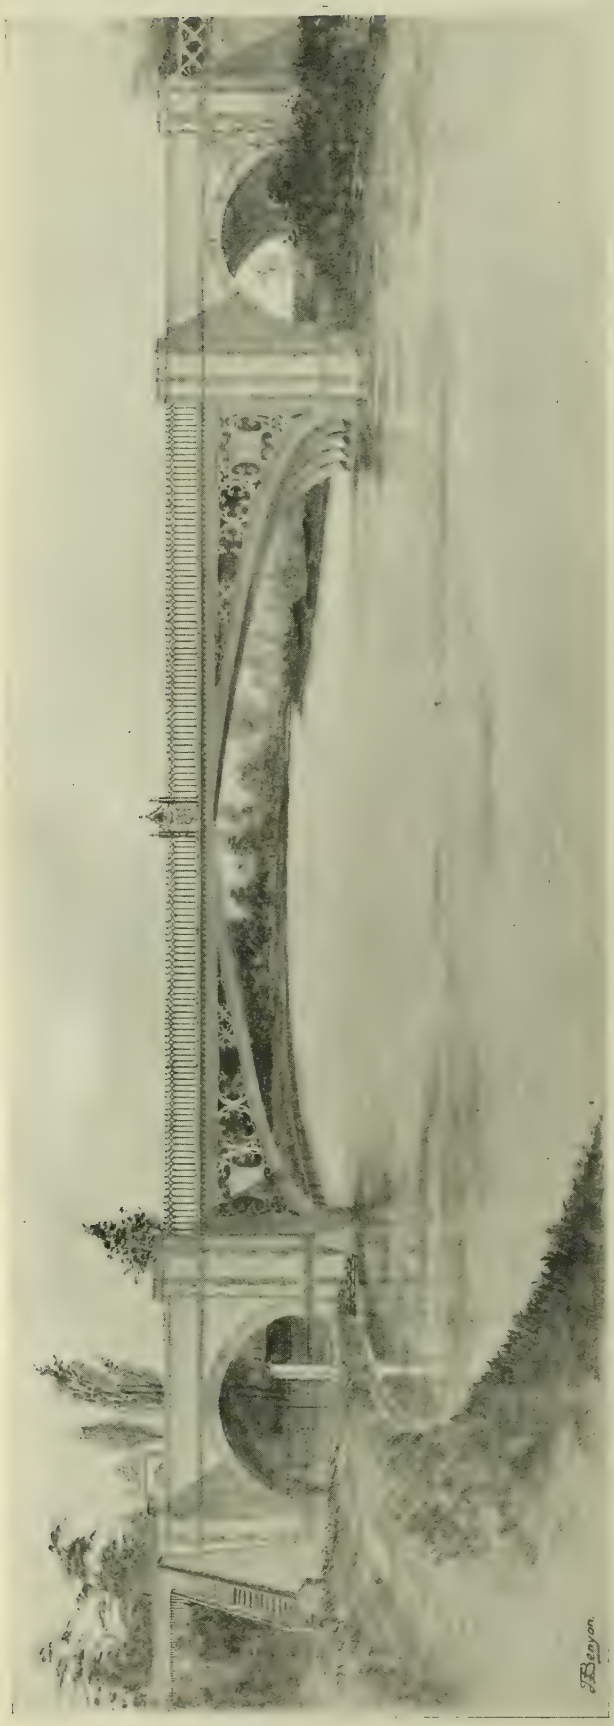
EXHIBITION NOTES

PATERSON'S GALLERY.



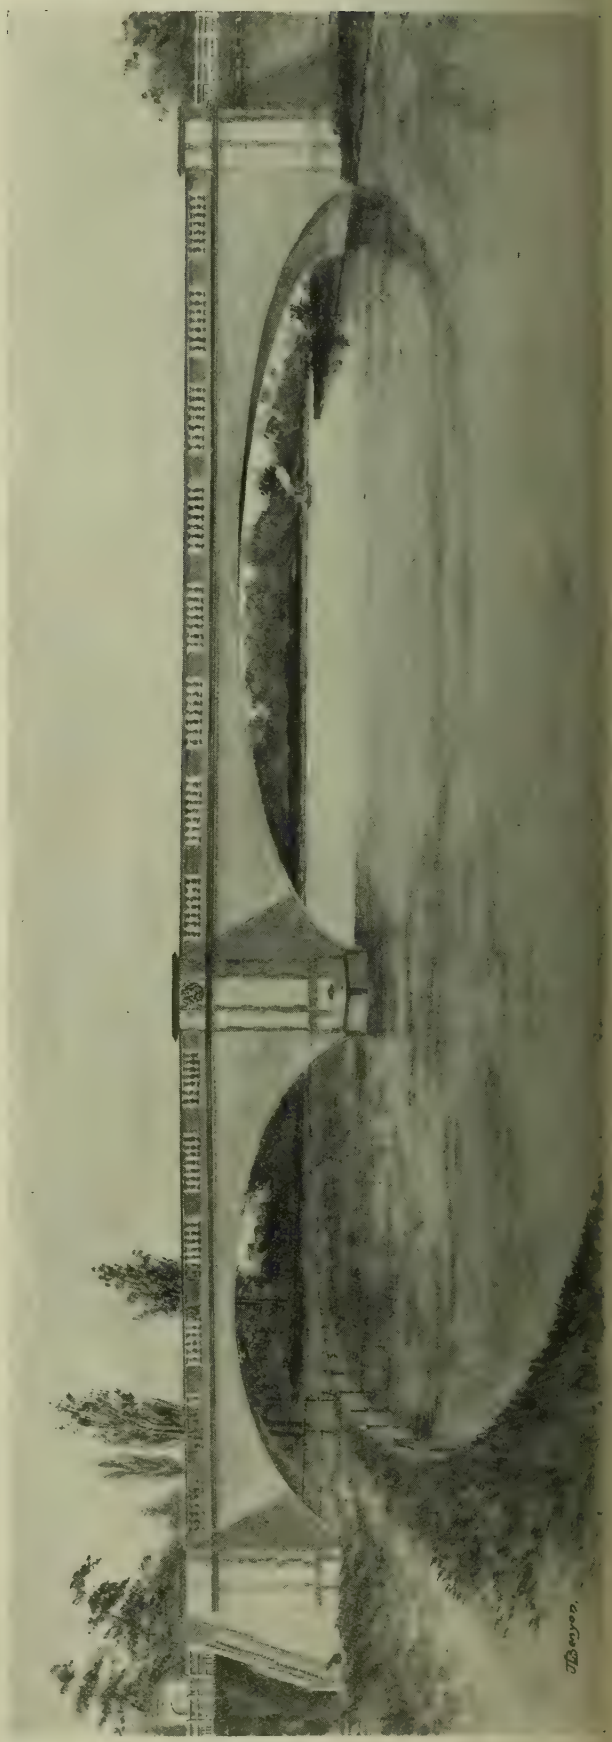
We have been so accustomed to interesting and attractive exhibitions at Mr. Paterson's gallery in Bond-street that we should hardly have expected to find there an exhibition like the present one of the Seven and Five. Words fail to exactly explain all one feels in the presence of most of these drawings. Perhaps one ought to regard with humorous concern the attitude of mind towards art and life which incites people to make such drawings, but if there were a likelihood that the public would be captivated by their particular charm we might feel more of concern than of humour. Certain drawings by J. R. R. McCulloch, G. R. Woolway and Alan J. Durst make one wonder how they got into the company of the rest, for these drawings and the few examples of sculpture are products of a different vision. The admirable conventional figure of the Madonna and Child, by Allan Hurst, a charming head by A. J. Oakley, and a finely-sculptured head by E. S. Frith are good enough things even for Mr. Paterson's gallery.

COLNAGHI'S GALLERY.



The drawings and etchings by G. L. Brockhurst, at Messrs. Colnaghi's, show sound and capable draughtmanship, reaching in some cases to a fine expression of line and tone. Perhaps if fewer subjects had been shown together, we might have escaped something of a feeling of tightness and over-elaboration which the sound knowledge and painstaking qualities of the artist have brought into rather strong expression; in some examples, however, especially in the pencil drawings, the results are certainly not lacking in distinction.

Building Trade Census.



A volume on occupations, in connection with the census of England and Wales in 1921, was published recently by the Stationery Office. Under the heading of builders, bricklayers, stone and slate workers, and contractors, there were 503,535 males and 1,743 females, the latter including 262 employers and managers, 76 glaziers, 127 tilelayers, mosaic workers, and composition floor-layers, 84 stone cutters and dressers, and 69 slate workers and slate masons. Painters and decorators (not pottery) totalled 104,811 males and 2,863 females.

Newcastle-under-Lyme High School War Memorial. Mr. W. T. Loveday, A.R.I.B.A., Architect. (*See p.* 973.)

THE PRESENT BRIDGE.

DESIGN OF THE NEW (JUBILEE) BRIDGE.

BOOK REVIEW

andbook of Housing. By B. S. Townroe, B.A. (London: Methuen & Co., Ltd.) Price 6s.

its kind. this is one of the most readable cations we have come across. The author ot together an enormous amount of infor- on which he has sorted out and grouped eight main sections, giving a carefully ned and comprehensive survey of the ipal aspects of the question. The book des in a handy and compact form the main es of the information needed by housing ittees, local authorities, architects, and ers. Interest in the book is considerably ased by the contributions from former ters of Health, and various authorities experts on the subjects of housing and rials. Sir Charles Ruthen, the Director- ral of Housing, contributes a useful survey e problem, and it is interesting to see that w realises that the housing failures, which ied so hard to excuse in various ways years ago, were solely the result of attempt- o ignore the laws of political economy. d, throughout the whole book, we note most of the contributors have come to see an abnormal demand for houses coupled a shortage in labour means higher prices. is connection it is interesting in the light perience to read Sir Alfred Mond's plan mpaign whilst he was Minister of Health. was a continual and rapidly rising curve sts and a reduction in output, until the esslike procedure of stopping the demand time was adopted. The result was exactly id been anticipated and prices fell con- ably. Sir Alfred Mond issues the warning inflation of prices must be prevented, wise the costs of building will rise to such tent as will inevitably wreck any scheme did before. Regarding housing in the e and its connection with subsidies we are two opinions diametrically opposed. ddison thinks that assistance from national will be required in some form, whatever od is adopted, while Sir William Joynson considers that housing difficulties will e permanent, that we cannot alter the of political economy, and that sooner or housing will find its economic level. With atter opinion most of the authorities seem in agreement, and consider that it is the tive which should be aimed at in housing. ur supply has been the vital factor in the ng situation, and the subject is fully dealt in this book. Discussions upon labour naterial lead naturally to discussions upon opments in construction and new materials, the object of trying to find some method of ng the housing and labour shortages at and the same time. Mr. H. O. Weller des two excellent chapters on new ials and concrete houses, followed by a er on new methods of construction ap- d by the Ministry of Health. In the er on the practical aspect of the housing em the author discusses the question of port and housing along with the doctrine elve houses to the acre. We are entirely eement with him, even if he is afraid that elief may be regarded as heresy by the ng reformers. There is a good deal of in the following extracts which convince at the author has a broad grasp of his ct :—" In this, as in other questions of n, it is possible that those housing reformers most pride themselves on their humani- n idealism are actually the most short- ed," and " With national customs changing dly, new methods of construction being t for, and the economic basis of modern lation shifting, too settled a policy in ng is folly." A summary of the Housing 1924, is included for the benefit of those wish to take advantage of the financial ance offered by the Government. We ently recommend this excellent and comprehensive book, and considering that it is published at a very reasonable price, it ought to be widely read.

NEW REINFORCED CONCRETE BRIDGE OVER THE THAMES

The work of demolishing the Albert Bridge over the Thames, near Datchet, and constructing a new one in its place, has now commenced. The new bridge will be constructed in reinforced concrete. The design, prepared by the County Surveyors of Berks and Bucks, was approved by His Majesty the King, and the bridge when completed will bear the Royal Arms. The illustrations on p. 980 show (1) the existing Albert Bridge, and (2) the proposed new structure.

The present bridge, in Gothic style, was designed by Prince Albert and was erected in 1852, and is not now capable of taking present-day traffic. The cast-iron arch-ribs are cracked in various places, due to contraction in casting, temperature, or vibration stresses, and the bridge has dropped at the arch crown.

Eventually it was resolved to construct a bridge capable of taking all classes of modern traffic. A ferro-concrete bridge was decided upon, but there were difficulties to be met, chiefly with the Thames Conservancy, as to the width of waterway at this important point on the river. However, at a later date, the width of waterway was agreed, and the new bridge will consist of two unequal span arches, the arch on the Berks side being 75 ft., and the arch on the Bucks side 110 ft., with a centre cut-water pier 15 ft. wide.

The arches will be of slab construction on which will be carried, by means of columns, the deck beams and decking. The balustrading and cornice will be of Bath stone, supported by reinforced concrete curtain walls which are so arranged as to be independent of the arch slab and decking. The towers and wing walls will be faced with squared rubble and stone dressings from the old bridge; seats will be arranged in the towers at footpath level as at present. This will be the third reinforced concrete bridge to be erected over the Thames. The engineers are Lt.-Colonel J. F. Hawkins, M.Inst.C.E., and the late Major R. J. Thomas, M.Inst.C.E.

The bridge will be constructed on the system of the Trussed Concrete Steel Company and will be built by Messrs. A. Jackaman & Son, of Slough (Bucks), under the superintendence of Lt.-Colonel J. F. Hawkins, County Surveyor of Berkshire; and Mr. E. Winfield, County Surveyor of Bucks.

ROSS SMITH MEMORIAL COMPETITION

The design illustrated on this page, by Mr. A. B. Hitch, A.R.B.S., has been selected in the competition for a statue to the late Sir Ross Smith. The idea of the design is to illustrate the great distance covered by Sir Ross Smith and his companions in their flight from England to Australia. The statue, in bronze, is mounted on a portion of a globe, which also finishes off the top of the pedestal. On two sides of the pedestal are figures representing "Flight" and "Intrepidity," the former a female figure in the act of soaring, holding an aeroplane, and the latter a male figure holding the earth and a palm of victory in the right-hand—denoting victory over distance. The bronze frieze is flush with the pedestal, and illustrates, on four sides, important countries passed by the airmen *en route*, namely, England, India, East Indies and Burmah, and Australia. The badge of the Royal Air Force is freely treated below. The whole of the sculpture and ornament would be of bronze, the pedestal in marble, the platform and base of granite.

Ross Smith Memorial Competition:
Accepted Design: By Mr. A. B. Hitch, A.R.B.S.

REGIONAL ARCHITECTURE

WE give below a synopsis of a lecture given recently by Professor A. E. Richardson on "Regional Architecture in the West of England," at St. Bride's Institute.

Professor Richardson said architecture to-day was of general interest, and its study was encouraged outside professional circles; thus it was that many new facets of the subject were continually being discovered, and the material seemed inexhaustible. From Norman times to the Reformation, building in this country was developed on structural lines influenced mainly by material considerations. They were pleased for convenience to call this development mediæval. No matter which period of mediæval work was taken for analysis, the general characteristics of the buildings were similar. But when they enquired more closely into the detail of the individual buildings of those times, they found the important factors of material and *locale* coming into play, effecting in turn subtle distinctions which, for convenience of grouping, could be termed regional.

After the Reformation, various new influences crept in from the Continent, which were destined to change the entire character of English buildings. Certain forms of ornamental decoration, mostly derived from Italy, France, Spain, the Netherlands, and Germany, were accepted as authoritative in this country. Then followed a period of compromise between the established system of building and the imported forms, until in the second half of the seventeenth century Sir Christopher Wren assisted the vernacular to a more definite level. From the early eighteenth to the middle of the last century the impetus given to building by the Wren school was in principle if not in detail more or less maintained. The modern movement in architecture about which so much had been said began in the 'seventies of the last century.

It should be borne in mind that the use of local materials, such as stone, granite, timber, cob walling, tiles, slate, or thatch, as well as brickwork, was in certain districts continued from mediæval times through the seventeenth century, and well into the eighteenth. It was equally true that in some districts the old methods of construction had been continued almost to their own day. At the close of the seventeenth century, the building examples of Holland were in the ascendant; hence the Dutch type of window and other architectural features associated with domestic building. This influence, strong as it was, did not long survive, for English artists fired by the story of the classic ruins of Italy and Greece, gradually made themselves acquainted at first hand with the remains of antiquity. Each decade witnessed some slight change in the design of buildings. These changes, however, did not alter the fundamental principles as followed all over the country. On such reasoning, as well as from concrete evidence, it could be demonstrated that regional characteristics persisted in every part of the country from the time of Elizabeth until the invention of railways brought about a disastrous facility of transport, for example, making it possible to use Welsh slates in a tile district, as well as encouraging the red rash of villadom without regard to local amenities. The critic whose mind was undeveloped might view English architecture of the past as evidencing the same form and the same detail in every part of England, but architects knew better. The correct view resulted from ability to perceive the local distinctions which the buildings showed.

The chief factors which they had to consider were those of local material and traditional methods of craftsmanship. In the West of England, particularly, from the earliest times, material had been the dominant factor. Arising from necessity, a system of proportion was evolved, almost a subconscious effort on the part of the builders, which outlived the importation of ideas from abroad, as well as from other countries. Such truths lead them to look more closely into the types of buildings which were a feature of the eighteenth and nineteenth centuries in Devon and Cornwall. They were faced with the simplicity of the designs, the low pitch of the roofs, the broad surface of the walls, the curious placing of chimney stacks, the shaping of the cappings, the homely interiors, and the odd doorways. In such features were to be seen the true regional characteristics. After the Napoleonic wars, when the country entered upon its industrial era, mass production succeeded to individual workmanship, and one by one the time-honoured crafts were suppressed. It was a fact, however, and one evidenced by the style of west-country work, that the proportions, in so far as country buildings were concerned, responded more directly to local tradition than similar buildings nearer London. The work, therefore, of this late period remained regional in the Dorian sense, but its details gradually became more akin to the general type.

At this present introduction of patent materials, such as asbestos slating, machine-made tiles, stamped steel houses, and reinforced concrete blocks as well as bricks without texture or surface quality, might have economic advantages which were temporary, but such materials should have no place in the picture of the country side. It should be the first aim of architects who were called upon to build in country districts, to ascertain the nature of local materials, and while aware of the uses of patents they should be careful to restrict them to internal construction.

For three centuries, building in the West Country in its more specialised branches had benefited by the works of London architects. These men, however, had first to master local conditions and to make use of the natural resources of the district in which their buildings were projected. On this showing, it was erroneous to speak of such examples as being exotic. The whole history of the later Renaissance in England was a long story of change and development, and the minor branches of this development were of as much consequence as the main issue. None would deny that the homely farms and cottages of Devon and Cornwall had distinction. The stone-built chapels and the meeting houses of the early nineteenth century showed something more than mere buildings. The introduction of classic ornament from time to time was interesting, but in reality it did not affect the structural qualities which, so far as the smaller buildings were concerned, remained constant.

In Exeter, Plymouth, Bodmin, Truro, and Penzance, there were individual buildings and terrace groupings which reflected the way London. There were stuccoed convent which might have been inspired by Nash well as mild copies of the architecture of Reg Park. The grey West with its climatic ditions demanded stucco as a protection ag the weather. Cornish granite was notori porous, slate shingling was expensive. In use of stucco was to be seen the wisdo Foulston, whose chief care was to pr his buildings with a weather coat. What desired in these anarchial times was not a r to any particular type of traditional build on the contrary, it was reasonable evolu New conditions had to be met; the buil laws had changed the proportion of cott To-day they were faced with problems demanded direct statement. There were, ever, certain unwritten laws which shoul observed, and no better standard existe a guide than the simple buildings of the pa

ROMANCE IN STONE

IN a recent lecture at the Central Scho Arts and Crafts on this subject, Sir Ban Fletcher, F.R.I.B.A., described the e ordinary development of Gothic architect as seen in the cathedrals of France. showed how the sombre and solid Romane gave way to the light and graceful Go and how this energetic and restless sty architecture gave expression to the Fr character. By balancing stone upon sto pier, vault and buttress they dispensed solid walls, and filled their places with giga traceried windows of blazing stained glass

During the Gothic period France cov herself with cathedrals, and the zeal w prompted their erection changed the fac their country, much as industrial life covered England with railways and facto Lantern views of Chartres, Laon, and o beautiful cathedrals showed that the ass tion of architecture and sculpture was bro to a perfection that has never been surpas The lecturer described French characteris such as the chevet, or rounded east end cluster of chapels, which, except at W minster, did not occur in England.

Art Treasures Destroyed.

A disastrous fire recently occurred at Trinity House. Art treasures and much v able furniture, including many Chippen chairs, were destroyed. Hull Trinity H was established in 1369. The damage is mated at many thousands of pounds.

A Shopfront near Mortimer Street.

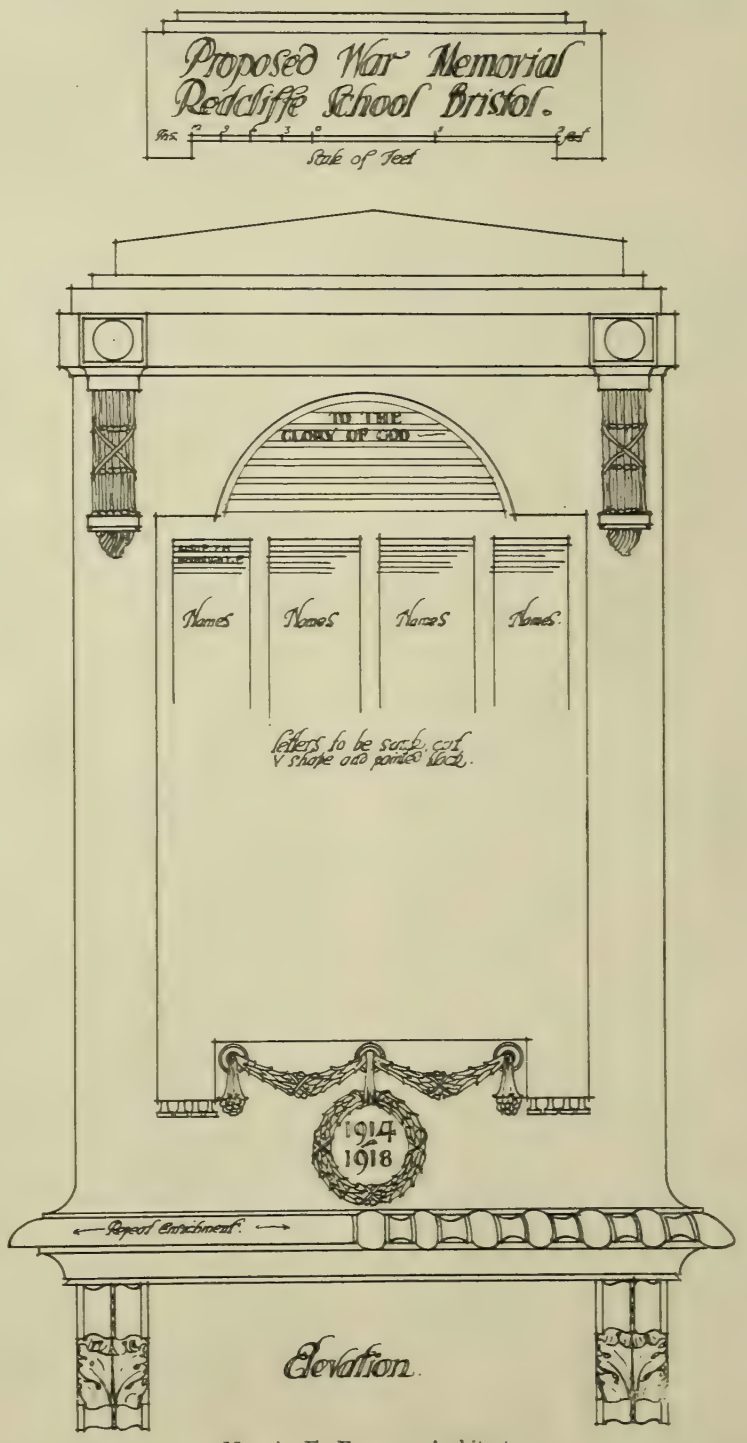
Messrs. W. A. PITE, SON & FAIRWEATHER, Architects.

TOWN-PLANNING INSTITUTE

MR. W. T. LANCASHIRE (President) took the air at a meeting of the Institute, held at 92, Victoria-street, S.W., on December 12, when A. F. Marsden, City Surveyor of Bradford, gave an address on "City of Bradford Town-planning Schemes."

Mr. Marsden illustrated his address with a large number of lantern slides, which included maps of planned areas, diagrams showing densities of population, photographs of the road works carried out by the city authorities to find work for the unemployed, photographs of the houses erected by the Corporation, and views of houses of historic interest being preserved under the town-planning schemes. In the course of his remarks he said that Bradford was the centre of the worsted and woollen industries, and the bulk of the people are engaged in some form of work connected with these industries. The results of the industrial movements were seen in a very marked degree in the city, especially in the lack of any plan of development, overcrowding, and absence of beauty either in design or surroundings of industrial premises and the housing of the working classes. The object seemed to be to put as many houses as possible on a given area with little regard to any amenities or air space, whilst, at the time of their building, the houses were surrounded by agricultural land.

The lines which had been followed in preparing the town-planning maps and schemes, however, had been to allocate areas for:—(1) housing purposes; (2) shopping and business premises; (3) open spaces; (4) industrial areas.



As to housing, the schemes were being varied in accordance with the varying suitability for greater or lesser densities.

The areas for shopping and business purposes were being allocated at junctions of roads, but the Council were not preventing shops being erected in suitable positions on housing estates, and they were consenting to the alteration of existing houses on main roads into shops, as necessity demanded. By these methods they hoped to keep the amenity of all residential districts, whilst at the same time providing reasonable shopping facilities for the residents of these districts. The hard and fast allocation long before an area was developed added very greatly to the problem of providing reasonable facilities for residential areas. The shopping centre problem was a very real one, especially in a city like Bradford, where by far the larger proportion of the houses were occupied by the artisan and working classes.

Bradford possessed ten principal parks and a large number of recreation grounds and playing areas within the city, and, in addition, Roberts Park, Shipley Glen, and Baildon Moor, lying immediately to its northerly boundary. One idea which was being prospected in Bradford was to provide playing areas of some description so that the children would be able to reach such an area without more than ten minutes' walk from their residences. Bradford had just had an order made by the Ministry of Health for one of the largest, if not the largest, sanitary area clearance schemes which the Ministry had ever dealt with, and the new layout of the estate was being treated on town-planning lines, although it was not within the area of any of the schemes.

In settling industrial areas, regard had been given to the question of transport of the workers, especially as the population under the new densities for housing would be covering very much larger areas. The scheme had been to provide for the improvement and widening of all the existing main arterial roads. In addition, new lines of roads were being laid down in all the areas, so as to ensure that main lines of communication should exist when the various parts of the cities came to be developed and built up in future years. The main arterial roads were being designed for 100 ft. in width over all, including tramway tracks, and the secondary roads 80 ft. and 60 ft. in width, the width being varied to meet as far as could be seen the probable traffic. The Bradford schemes were providing in all cases for building lines on all the arterial roads and other secondary roads branching therefrom varying from 20 to 35 ft. according to circumstances. Much encouragement had been received for these building lines by the way in which builders and owners of property had adopted them because they were beginning to realise the many advantages which accrued to their property where it was used or developed for housing purposes or for shops or business premises.

On account of the varying levels and irregular configuration of the city it was impossible to preserve very many long straight roads in the city, and detours have to be made in many of them in order to overcome engineering difficulties and to keep the cost of the roads within reasonable bounds. An inner ring road had been designed, a large proportion of which was already constructed, although not to the full width intended, and a scheme was now in hand which would complete one of the more important intervening sections. An outer ring road had also been laid down, but most of this outer ring road was outside the city boundary. The

MR. A. F. FRENCH, Architect.

[This memorial has been erected in the Lower Hall of Redcliffe Endowed Boys' School, Bristol, to the memory of the 198 Old Boys who were killed in the war. The memorial is of Caen stone, with raised panel for inscription with the names sunk and V-cut, painted black. The architect for the work is Mr. Alec. F. French, of Weston-super-Mare, and the whole was executed by Messrs. Humphrys & Oakes, of 109, Lawrence Hill, Bristol.]

outer ring road had been laid out so as to fit in with the outer ring road of the city of Leeds, the two roads together forming a figure eight, one portion being common to both cities.

The usual practice in Bradford was when an owner wished to develop an estate he applied to the Corporation for particulars as to any restrictions or lines of new roads which would have to be observed, so that he could make these the basis of his development. As a rule he was supplied with a small sketch map showing upon what lines it was possible to develop his estate, which he could either adopt, amend, or substitute by another design. Any lay-out which was approved had to provide for the new roads and widenings. In the lay-out of these estates advantage was generally taken by the owner of the relaxation of building regulations to the extent of making much narrower streets with a minimum distance between buildings of 75 ft.; then he was asked to dedicate free of cost any land which might be necessary for the widening of existing highways, besides providing the land for all the new arterial roads required by the town-planning scheme. If he were not prepared to meet the Corporation in this way, the Corporation claimed to exercise their option as to whether or not they would permit the relaxation of building regulations. The owners recognised the advantage to them, and met the Corporation's wishes, but in some cases the Corporation agreed to pay the extra cost of making any road through the estate of a greater width than 60 ft., as this was the width which might be required by the present building regulations in the city of Bradford for main through streets, but, in any case, they could require a street to be made not less than 42 ft. wide. Under this arrangement the Corporation had had dedicated to them 100,000 sq. yards free of cost.

Bradford was of such recent growth, comparatively speaking, that in the areas covered by the town-planning schemes there was not a large number of ancient monuments or buildings which required particular preservation because of their antiquity. There were a few, however, such as Bolling Hall (owned by the Bradford Corporation), Horton Hall, and Royds Hall, none of which would be disturbed by any of the town-planning schemes. In nearly every case the owner of these old buildings was as anxious as the Corporation to preserve the amenities of them, and there was no immediate fear that they would be surrounded by buildings or the adjoining lands used in such a way as to mar their own characteristics.

In all the town-planning schemes great care had been taken as far as possible to work in conjunction with all the adjoining districts. Happy negotiations and discussions had taken place with representatives of most of the districts adjoining the city, who had followed the example of Bradford and taken up the question of town planning in an enthusiastic manner. Under such circumstances it would readily be seen that Bradford and its neighbours were working together, so that when the whole district became town planned and developed it would be a satisfactory whole rather than in so many separate and distinct plans. Such negotiations and mutual arrangements had been come to with the following:—County boroughs: Halifax and Leeds; and urban districts: Bingley, Baildon, Clayton and Shipley.

Possibly some of the success and favourable attitude of the owners of the estates was due to the fact that Bradford had always believed in the greatest publicity of town planning, and to further it they had permitted the author to attend public meetings in various parts of the city and allowed a very large amount of work to be done in the way of preparation of plans and other information to show the advantages of development on town-planning lines. In this connection an advertisement issued by the Corporation in the local press appeared at least every three months drawing the attention of the public to the fact of town planning, and advising them to make application to the author before purchasing any lands in the city, and this advertisement had proved of great benefit both to vendors and purchasers. As a matter of fact, no less than 4,528 inquiries had been made besides innumerable interviews on the subject. From these facts, it would be seen that a spirit of co-operation was gradually being developed between the owners, purchasers, and the Corporation, which was leading to very happy results, and the opposition which was at first experienced was quickly disappearing.

An interesting discussion followed in which Messrs. L. G. Pepler, Col. C. H. Bressey, (Minister of Transport) F. G. Elgood, Raymond Unwin, E. R. Abbott, Allen, and the President took part.

Col. Bressey suggested that as the Traffic Advisory Board was to control an area of about fifteen miles all round from Charing Cross, it would be a suitable thing if the Regional Committee for London dealt with the same area.

Mr. E. R. Abbott raised the question of what ought to be considered suitable buildings for placing on arterial roads, and suggested that it would lend itself to an evening's discussion.

Mr. Allen asked if the fact of Bradford having nine schemes of about 2,000 acres each meant that as the result of practice it had been shown this was a suitable area to deal with.

Mr. Marsden said the reason for having nine schemes was with the object of getting something done quickly.

LAW REPORT

Action by Architects.

AN arbitrator's award in the form of a special case, in which the parties concerned were Mr. Thomas Peter Clarkson and Mr. Herbert Austen Hall, both architects, came before Mr. Justice Roche in the King's Bench Division on December 3, the matter being in relation to a professional dispute.

Mr. Barton, counsel for Mr. Hall, said that his client and Mr. Clarkson, as well as another gentleman who was Mr. Clarkson's brother, were employed by Messrs. Peter Robinson & Co. in connection with a new building scheme for their Oxford-street premises. The scheme was in two parts, one being for the eastern block and the other for the western block. There was an agreement of November 4, 1914, providing for the employment by Messrs. Robinson of the three architects in relation to the eastern block.

Following that agreement, the architects entered into an agreement on November 5 among themselves in the matter. In 1916 the work on the eastern block was stopped and, as a consequence, Messrs. Robinson paid the architects certain sums. The architects had acted in the meantime in connection with the western block of buildings. Mr. Clarkson was a director of Messrs. Robinson & Co. After some time the Company decided to proceed with the eastern block, and Mr. Hall discovered that, although there was an agreement which specially provided that the architects should work together in connection with any future business obtained for them from Messrs. Robinson, Mr. Clarkson had been appointed sole architect for the eastern block, which was work in which the architects had previously acted. Mr. Hall's case was that the partnership agreement between the architects still subsisted, and that subsequent work on the eastern block should have been obtained for the partnership. The matter went to arbitration before the President of the Institute of British Architects, before whom an objection was made on behalf of Mr. Clarkson that the architects' agreement, being merely supplemental to the first building agreement of November 4, 1914, had come to an end, and that, therefore, there could be no submission to arbitration.

The arbitrator heard the evidence, without prejudice to the preliminary objection, and made an award, the effect of which was, if his Lordsl was of the opinion that there was a subsisti submission to arbitration, his client (Mr. H was to recover one hundred guineas, and co of the reference and award.

Counsel went on to say that the work on t eastern block was stopped in 1916 owing increased costs, and the architects were p 2½ per cent. on the estimated cost of t building.. When it was decided at a la date to proceed with the eastern block, Mess Robinson resolved it was not necessary employ an outside architect. and that t work would be more economically and efficien dealt with in the Company's own offices. Clarkson was appointed architect. In claim before the arbitrator, Mr. Hall alle (1) that the partnership agreement of Nove ber 5, 1914, still subsisted; (2) that the cond of Mr. Clarkson in agreeing with Mess Robinson, Ltd., to be sole architect for completion of the eastern block was a brea of his duty to his partners under the partnersl agreement of November 5, 1914, and that t alleged breach had prevented the partnersl from earning certain fees; and that Clarkson was liable for such loss. Mr. Clarks objected that the agreement of November had been determined, the original service of t architects having been paid for and subseque services dispensed with, and that that agr ment having terminated, the agreement November 5 was of necessity also terminated.

Mr. Barton said he supported the arbitrato award, and argued that the agreement question never came to an end.

Mr. Barrington Ward, K.C., for Mr. Clarks contended that the agreement had ended.

In his judgment, Mr. Justice Roche said was contended by Mr. Hall that the partn ship agreement of November 5 still existe It was not really a partnership agreement, b an agreement providing for joint action architects in certain specified matters. Hall also alleged that Mr. Clarkson's condu was a breach of the partnership agreement. his (his Lordship's) opinion the complai against Mr. Clarkson was not well founde The agreement of November 5 was supplement to that of November 4, which related to t employment of the three architects by Mess Robinson on the eastern block. The agreeme of November 5 provided for the distribution duties and rights and benefits among t architects under the principal scheme. It al contemplated that there might be other matte in respect of which Messrs. Robinson mig choose to employ them, and if so employed other matters the architects would act up the terms of the November 5 agreement. F the eastern block nothing had been done 1916 except tenders were invited, but contracts entered, and the matter was th not taken up again until 1923, when M Clarkson alone was appointed as architec The arbitrator had found Mr. Clarkson w wrong in the matter, but he (his Lordshi thought there was no contract on the part Mr. Clarkson which was broken, and a breac which could give rise to Mr. Hall's claim f damages. He (his Lordship) had no doul that the agreement of November 4 had be put an end to, tenders for the building apparent having been declined by Messrs. Robinson, ar in those circumstances it could not be argue successfully that the agreement of November gave any right in connection with the easter block to either of the parties. When th November 4 agreement terminated, there wa no obligation upon Mr. Clarkson to do anythin to secure or attempt to secure for Mr. Hall an himself a further agreement. So far from being the right and duty of Mr. Clarkson t invite the giving of work to Mr. Hall an himself, having regard to the relations of M Clarkson to Messrs. Robinson, there was a goo deal to be said for the contention that his dut was the other way. He (his Lordship) decide that the arbitrator had no power to make th award on a claim that Mr. Clarkson had com mitted a breach of agreement as alleged. Tha disposed of the matter.

RCHITECTS' & BUILDERS' INQUIRY BUREAU

. are glad to give questions and answers, but cannot . responsibility for contributed replies, especially to matters.

. we appeal to our correspondents to submit their . on paper of a size easily filed, and written as . as possible, or better still, in typescript.—ED.

Recovery of Fees.

R.—As an old established architect, I invite of your readers who have had experience he following points of law, or have seen decisions, to give me and your readers the fit of them :—

any years ago the enquirer was appointed itect for a Nonconformist church and schools, ared working drawings and specification the whole scheme, plans of which were ed by local authorities, the school portion being proceeded with owing to lack of funds. was paid commission only on the portion ally carried out at the time. It was thought the church would be proceeded with at arly date, but time went on, and it is only to be proceeded with. The present trustees e of whom are new men) think they are to appoint another architect for the church out first settling with him ; no account was ered at the time ; it was thought by him the appointment of architect constituted a ract, the Statute of Limitations not applying

is now stated on behalf of the trustees that debt or contract should have been renewed odically to make it enforceable. Another case ere an architect won a competition and after- s was appointed architect, and prepared ing drawings and specification, and got plans d by the council ; the work was deferred ow- o the war, and only a very small amount paid count at the time. The question will arise is latter case, another architect having been inted, whether the first architect can claim ice of fees, and, if so, whether he is entitled se his charges on the pre-war estimated cost on the present estimated cost of the build- and whether he should claim as "balance es," or for damages for breach of contract, oth ?

"LAW."

Flooring Battens.

R,—I should be greatly obliged if any of readers would inform me whether ordinary flooring battens laid in mastic on cement rete make a good lasting floor, and of a good, cheap mastic is composed ? Should the cost be cheaper than boards on joists, the necessary sleeper walls, air space and extra excavation ?

L. WILLOUGHBY THOMAS.

Thickness of Lead.

LY TO "YOUNG ARCHITECT," DECEMBER 5.]

R,—Referring to "Young Architect's" y asking for information dealing with the ness of sheet lead, and the best way of suring same, I trust the following infor- on will be of some use to him :—

). Sheet lead	.068 in. thick	($\frac{68}{1000}$ of 1 in.)
. „	.085 „	($\frac{85}{1000}$ „)
. „	.101 „	($\frac{101}{1000}$ „)

micrometer, as used in an engineer's shop, would be a good instrument to use measuring the thickness of the lead, as it is stable to a great degree of accuracy, and rds in thousandths of an inch.

"KENT."

Communion Railings.

R.—Can any of your readers inform us re it is possible to obtain old church com- ion railings and balusters, in oak—Jacobean r Carolean preferred ?

lso old stone statuettes (or modern) repre- ing SS. Peter and Paul.

"CHURCH RESTORATION."

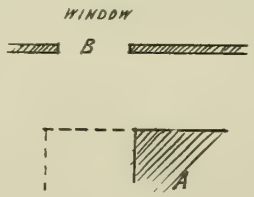
Hot Plates.

[REPLY TO "BAFFLED," DECEMBER 5.]

SIR,—If "Baffled" will be so good as to pay a visit to any well-stocked showroom of a gas undertaking and ask to see an elevated gas range (that is to say, a range with the oven raised on a stand about 2 ft. high, and with a hot plate fixed on the stand to the right of the oven), he will find that immediately above the oven there is an enclosed chamber from 12 to 15 in. high specially designed for warming plates or keeping food warm. This chamber utilises any waste heat which comes through the top of the oven ; and when the oven is not in use the chamber can be heated up by some small gas jets provided inside the chamber. This appliance should meet "Baffled's" needs exactly, if he is referring to difficulties experienced in his home. Should he desire to warm large quantities of plates, he can have a gas-heated hot closet capable of warming up at one time 100, 200, 500 or any greater number of plates

"B. C. G."

Decay in Stone.



[REPLY TO "CONSTANT READER," DECEMBER 5].

SIR,—For the preservation of stone I think there is no remedy that is applicable to every stone, Each stone must be dealt with according to its component parts, and if my 40 years' experience and observation are of any use to "Constant Reader" I should be pleased to give him my help if he sends me a sample of the stone he wants to preserve.

FRANK MORTIMER.

Building Lights.

SIR,—Is a building considered to interfere with the right of light to another building unless it is actually opposite that building ?

That is, would the building "A" be considered as interfering with light to the window "B," or would it be considered as interfering only if it were continued as shown by dotted line ?

S. T. C.

Stonework Wash.

SIR,—We should be glad if any of your readers could give us any information on the following point :—

A customer of ours is building a church of Darley Dale stone in a dirty industrial town. Can you recommend a wash of any description to use on the interior stonework of the building which will keep it clean and can be easily removed when the roof is on ?

"H. S. E."

Dry Rot.

SIR,—The manufacturers of certain timber preservatives claim that it is possible to cure dry rot by the application of their special solutions. If any reader has experienced a cure, some details of the process adopted would be very much appreciated.

"FUNGI."

Brands of Timber.

SIR,—I require a few samples of the various sorts of timber for the purpose of distinguishing between them. Will any of your readers kindly inform me where I can get these ?

E. J. WRIGHT.

Protection of Oak.

SIR,—I have been advised recently that it is useless to treat English oak by the process of creosoting under pressure owing to its density which, it is alleged, does not permit of the creosote penetrating into its pores. I noticed in these columns a few weeks ago a very interesting letter dealing with the effect upon pitch pine piling in harbour work, where it was stated that the above treatment was found to be a great protection although only penetrating a bare $\frac{1}{8}$ in. I should be very interested if the same or any other correspondent who has had similar experience would advise me whether the same benefits can be obtained when English oak for ordinary outdoor work is treated by creosoting under pressure.

"ARCHITECT."

Ham Hill Stone.

SIR,—Can any of your readers kindly inform me where can be seen any buildings built in Ham Hill stone, which, I believe, comes from a Somerset quarry ?

"MASON."

Factor of Safety.

SIR,—At a time when the high cost of building has become a matter of paramount importance, it has occurred to me that much unnecessary expense is daily thrown away in the design of structural steelwork by the use of so high a factor of safety of 4. Surely this is carrying caution to excess now that steel is tested to such a fine point, and the quality is so dependable, or is there some reason of which I am unaware that makes this universal practice accepted ?

"ECONOMIST."

Cheap Roof Trusses.

[REPLY TO "PROGRESS," DECEMBER 12.]

SIR,—Your correspondent should consider the design of a laminated truss, built up of light material. Such a truss for a span of 20 ft. might well take the form of two 4 in. by 2 in. rafters, stiffened by two 5 in. by $1\frac{1}{2}$ in. collars, with a single king post of the same scantling, and with two ties of the same scantling from the feet of the rafters up to the foot of the king post. The truss should be further strengthened by short angle ties across from rafter to rafter immediately under the ridge, and across the angles between the rafters and the collar, so as to grip the purlins which will rest on the collar close by the rafters. Such a truss can follow the line of the common rafters and rest on the same plate, and there is a minimum of framing and material. The members passing between other pairs are simply spiked through and a strong job is assured without bolting.

"CARPENTER."

Cement Flashings.

[REPLY TO "SAXPENCE," DECEMBER 12.]

SIR,—The real objection to cement flashings is not a matter of the quality of cement so much as the rigidity of the parts of the building between which the flashings are made. Generally they occur between a rigid wall or chimney stack and a non-rigid timber roof. The flashings are made and the roof settles and draws away with it the, perhaps, perfectly watertight flashing, and the damage is done. With a lead flashing and soakers this movement of parts is permitted without the opening up of a weather gap, and such vital points of a building should not be the subject of a false economy.

"PENNY WISE."

Lime Wash.

SIR,—Is it necessary, to make a successful lime wash, to add a certain quantity of glue or boiled oil ? I have used both of those in lime wash. But in the present case the walls are partly covered with climbers, roses, &c., and I am of the opinion that to add either glue or oil to the lime would probably kill those plants.

"READER."

THE WEEK IN PARLIAMENT

WESTMINSTER, *Wednesday.*

DURING the debate on the motion for the presentation of an address by the House of Commons in reply to the King's Speech, many references were made to the housing problem.

Mr. Ramsay MacDonald, the leader of the Opposition, urged that in any new forms of construction which might be adopted, the countryside should not be covered with unseemly dwellings, which were an insult to the eye of the passer-by as well as an inconvenience to those who dwelt in them. We had had far too many engineers and far too few architects in the building of our houses.

Mr. Baldwin, the Prime Minister, expressed his sympathy with Mr. MacDonald's plea, but pointed out that the first necessity at a time like this was to try and get houses. If houses, even of a more temporary nature, would help to ease the situation in the slums, this was a time when the health and well-being of the people must take precedence even of æsthetics.

Major Wheler, a Unionist member, suggested a greater development of the brick-fields of the country in order to get the increased number of bricks required. He also hoped that the Government would devise a scheme for the employment of more labour for house building.

Mr. Morgan Jones, the Labour member for Caerphilly, alleged that the Chamberlain Act had been a failure, not a single house having been built under it in a mining valley in his constitutency.

Lieut.-Col. Fremantle, Unionist, and a former chairman of the L.C.C. Housing Committee, believed that the purchase of middle-class houses through building societies would lead to a very material solution of the housing problem. The essential thing in the new housing programme was the question of distribution. Town-planning schemes had lagged behind since 1909, and new legislation was required to enable town-planning to be completed to apply it to already built-up areas. So far as London itself was concerned, one could see a vista of the old London gradually coming to an end and its housing replaced. That replacement should be done on proper lines. The authorities should have power to take over sufficiently large areas and to reconstruct them, not simply to improve streets where they were, but to make a change on a much larger scale. The traffic problem would also have to be considered in this connection.

Sir Leslie Scott, a former Unionist Solicitor-General, held that the solution of the housing problem in the docks district of Liverpool lay in the provision of tenement buildings. With regard to small dwelling-houses, we should not get the mass of houses required unless we got the private builder back in larger numbers.

Use of Concrete Blocks.

Mr. Hardie asked the Minister of Health whether he would prohibit the use of all wet concrete blocks for house building and sanction the dry method ?

Mr. N. Chamberlain said he had no information which would justify the prohibition of the use of concrete blocks made by the wet process, although the dry method of manufacture was that almost invariably adopted for housing work

Grants for Cheaper Type of House.

Colonel Applin asked the Minister whether, in view of the present nature of the housing question, he would consider making a grant for immediate erection of types of ferro-concrete and other cheap houses to enable local authorities to see sample houses in being, with full particulars as to price, labour and time required for their construction.

Mr. N. Chamberlain said he would give very careful consideration to the suggestion.

Rating of Empty Houses.

Mr. Gillett asked the Minister whether, in view of the urgent need for more accommodation and the fact that many houses were standing empty waiting to be sold, he would consider the desirability of introducing a measure next Session for the part rating of empty houses ?

Mr. N. Chamberlain said he doubted whether the remedy proposed was a practical one, and he could not undertake to introduce legislation for the purpose suggested.

Output of Bricks.

Sir Kingsley Wood, Parliamentary Secretary to the Ministry of Health, informed Mr. H. Williams that there were no reliable figures available for the pre-war production of bricks, but it was estimated that the average production for the three years prior to the war was 2,805 millions per annum. It had been estimated that the production capacity of brickworks at the present time was about 5,000 millions, and the actual output this year would probably approach this figure.

Government's Housing Policy.

Mr. N. Chamberlain, the new Minister of Health, gave a general survey of the housing position and dealt in detail with the Government's policy in reply to an amendment to the Address of thanks for the King's Speech in the House of Commons on Tuesday. The amendment, was moved by Mr. Wheatley, the late Minister of Health, in the following terms: —"But humbly regret that your Majesty's advisers are committed to a policy of leaving the solution of the housing problem mainly to private enterprise and the operation of occupying ownership, thus ignoring the importance of carrying out a long-term scheme of building houses to be let at rents within the means of the working-classes, and failing to take every advantage for increasing employment in the building and auxiliary industries."

Mr. Chamberlain, in his speech, explained first of all that he should not for one moment think of interfering with the discretion of a local authority which desired to employ direct labour, provided that authority could show that it was the most economical way of carrying out their contract. The present position of housing was that under the 1923 Act the number of houses approved up to date in the case of local authorities was 53,535, and in the case of private enterprise 116,858. In other words, private enterprise had done rather more than twice as much as the local authorities under that Act. To get a true picture of what was going on to-day in the solving of the housing problem they must not take merely the number of houses which were being built under one particular Act; they must consider the total number of houses which were being built in the country. For the twelve months ended September 30 last there were built no fewer than 110,000 houses. These were actually completed. Of these 14,500 odd were built by local authorities, and 95,362, or 86 per cent., were built by private enterprise. The maximum number of houses ever built in one year in this country was 129,000. It was a remarkable fact that to-day, already, in spite of the extraordinary limitations of labour and material, that they should have got within 19,000 of that figure. Out of these 110,000, upwards of 90,000 were of a rateable value of under £26 a year. On October 1 there were actually under construction another 92,000 houses, of which 71,000 were being built by private enterprise. He therefore drew the conclusion that not only was private enterprise now supplying the greater number of houses constructed in the country, but he expected that the rate of building during the next twelve months would be very considerably in excess of that estimated last year and even of the maximum number which he had quoted. The Act of 1923 had provided a reservoir of houses of a standard of accommodation very much in advance of what the working man was getting to-day, and these houses would eventually come within his means under the Small Dwellings Acquisition Act, 1899. As amended by the 1923 Act, 10,168 houses had been purchased by their occupiers through advances made to them.

Although he did not consider that the Wheatley Act would add one single house to the number that would have been provided if the Act had never been passed, it was not his intention to discourage local authorities nor to the difficulties in their way. He would give the Act a fair trial. It must stand or fall by its performances. But he could not promise that if it turned out to have failed it would remain in its present condition. He considered Mr. Wheatley's scheme to organise for the augmentation of labour and materials and for better distribution was a statesmanlike piece of work. He would support and increase that work by every means possible, for the whole key and crux of the housing problem was in the supply of labour and material.

He did not contemplate the introduction of legislation dealing specially with the manufacture of materials. The Government would keep a watchful eye on all costs in connection with the building of houses, and if they found reason to suppose that the public were being exploited, whether by manufacturers, by labour, by tractors, or anybody else, they would take their own measures to put a stop to such exploitation. The most they could hope for was an increase by 36,000 in the number of houses erected annually instead of the 50,000 contemplated by the Wheatley Act. It was necessary, therefore, to see if there was not some way of supplementing the present method of house building by some new materials or new methods of construction. If at the same time by using these new methods they could do something to diminish the great army of unemployed they would be doing a real service to the State. Mr. Chamberlain referred to his recent visit to Glasgow to see the work of Lord Weir and others in the building of new types of houses. He came back full of hopeful of the future. The idea of steel houses might seem strange to many people, but it was a misnomer so to describe those erected by Lord Weir. He was not going to try to force steel houses on anybody who did not want them, but he was anxious that working people should have an opportunity of judging for themselves. He had, therefore, made an arrangement with Lord Weir under which he had undertaken to set aside a part of his factory for the production of a certain number of these houses for demonstration or experimental purposes, to be supplied to local authorities. In order that this might be done quickly and local authorities might be ready to take these experimental houses, he had, with the concurrence of the Chancellor of the Exchequer, set aside a sum of money from which he would give a grant to any local authority that took taking these experimental houses. In return he asked the local authorities not to let them, at the outset, at any rate, but to erect them on some spot where they could be readily visited and inspected by the public. He hoped by this method very speedily to get erected in different parts of the country a number of these so-called steel houses in positions where people could view them and judge whether or not they were suitable for their accommodation. The houses were not unpleasing to the eye from outside and they were thoroughly comfortable and home-like inside, and he believed they would meet with very widespread favour. The cost must to some extent depend on the quantity ordered. He hoped it might be substantially lower than that of an ordinary house. He thought there would be a considerable number of houses submitted for approval, comprising new methods and new materials, and ultimately they would get down to two or three types. If the experiment proved successful, it would bring them substantially nearer the time when they could deal with the slums. They must relieve overcrowding before on a large scale, they could deal with the slums.

After a debate lasting several hours, the amendment was rejected by a large majority.

Radley College.

H.R.H. the Prince of Wales recently opened the new library at Radley College, which has recently been reconstructed and renovated by Messrs. G. H. Carter, Ltd., of Holloway, N. Messrs. Knapp Fisher, Powell & Russell, of Westminster, were the architects.

THE BUILDING TRADE

LONDON MASTER BUILDERS' ASSOCIATION

ANNUAL DINNER

Hotel Cecil, on Thursday last week, RY T. HOLLOWAY (President) presided nnual dinner of the London Master and Allied Industries' Association. the 350 members and guests present ssrs. H. J. S. Abrams, A. H. Adamson, H. D. Anderson, R. S. Ayling, A., Herbert Baker, A.R.A., J. H. Bradford, E. J. Brown (Director of ciation), Lord Burnham, Messrs. G. M. n Carter, W. E. Collier, A. B. H. Colls, Culver, T. S. Darbyshire, A.R.I.B.A., J. Davis, F.R.I.B.A., J. D. Daymond, exter, H. Dicksee, A.R.I.B.A., J. E. F.S.I., H. A. Fairhead, W. G. Faldo, alkner, L. R. Ford (President, District r's Association), G. Topham Forrest rchitect of the L.C.C.), F. Lindus Forge, Forsdike, W. A. Forsyth, F.R.I.B.A., Gascoyne (President, Associated Master rs), F. J. Gayer, C. Lovett Gill, .A., Herbert Gleed, W. Curtis Green, B. P. Greenwood, F. L. Griggs, W. H. F.R.I.B.A., F. Harbrow, C. G. Hare, d A. Haskins, H. H. and R. Holloway, an, G. W. Humphreys (Chief Engineer, F. D. Huntingdon, S. Gordon Jeeves, D. Palmer Jones, W. Kaula, Sir Walter e, Messrs. W. A. Leaning, F.S.I., H. hant, F. W. Loasby, H. M. Lorden, ay, F. A. and F. G. Minter, G. Perry V. G. Newton, A.R.I.B.A., Sir Cecil e, Mr. F. Peaker, Sir F. Rice, E. J. , A. Roberts, A. and S. E. Roome, ddenham (Secretary of the Association), in Savill (President, Surveyors' Insti- Messrs. J. M. Theobald, F.S.I., F. W. J. Tozer (President, London Foremen's Association), A. F. A. ne, C. C. and F. Trollope, F. W. Troup, .A., A. F. Vigor, E. H. Wall (Assistant y of the Association), F. J. and L. S. Septimus Warwick, F.R.I.B.A.

oposing the toast of "The Architects Sveyors," MR. A. H. ADAMSON said the industry had been passing through a cficult stage, and what with heavy taxa- erce competition, shortage of skilled and difficulty of obtaining material, the e found their hands fairly full. Yet it l human touch and the spirit of kindly ction which made everything worth , nd they were pleased at those annual gs to have the opportunity of getting h with the architects and surveyors. had noticed with interest the recent nation of the Society of Architects and Real Institute of British Architects. They rulated the architects on that step, and he words of the president of the Society tects, expressed in his recent presidential that the fusion might strengthen the n in its relations with the public, and to speak with a united voice. Builders eful that with this amalgamation fresh minds, architects would do everything power to support the serious effort was being made so that builders, too, peak with a united voice. The builders ed by the National Federation of g Trade Employers to negotiate with ratives carried a heavy responsibility, only were they occupied with the rs' interest, but they were safeguarding rests of the architects and the surveyors, identally protecting the operatives from anny of a turbulent minority. The trike showed that the builders had the upport of the architects. The change ernment had given confidence, and confidence no industry could flourish. should remember the words in the Speech at the opening of Parliament, g for mutual confidence between masters and men, and he thought builders and operatives had already got near to that ideal, and the settlement of the recent strike was proof of that. If there could be a greater number of conferences between the architects, surveyors, and builders, all contributing from their individual experience towards the settlement of the many problems facing the industry, it would prove to be of the greatest good to the industry, and help in the settlement of many vital questions. If, for instance, the fierce burden of competition could be lessened it would be of great benefit to the industry, for he was sure no one wished a body of men to give so much of their time for nothing, as the builders were forced to do under present conditions. A conference of architects, surveyors and builders could also be of help to the Government in the housing difficulty, and thus lift a millstone from the neck of the industry. There was much talk of alternative materials for housing, but could not they get together and improve the output of materials in this country and stop the tremendous import of materials from abroad? Another thing which he thought would result in a great deal of good to the industry would be for young architects to spend some time in a builders' office and on building works, and for young builders to spend some time in architects' offices, and they had already gone some way in the matter of getting architects and builders to know one another's difficulties better by founding a Chair of Building at Cambridge University.

MR. W. G. NEWTON, in responding, said the architect and builder were once one, but now, owing to the specialisation of modern life, they had become separated and performed separate functions; the chief difference between them was that the architects' establishments and incomes were small while the builders' establishments and incomes were large. The work produced by the average builder in this country was of a very high standard, for the English workmen took a lot of beating. It was very necessary there should be a breaking down of suspicion between the masters and the workmen, and a strengthening of mutual confidence. A great deal depended upon the way the men were spoken of. Speak well of the men and they would respond. The more they could do to encourage the craftsman to take an interest in his work, to show him that his share in the task was recognised, the more likely they were, in the speaker's opinion, to settle the labour difficulty. As an instance of what could be done in that direction he mentioned that on a building being erected for him by their chairman, the building committee had asked that the names of the workmen should be inscribed on that building. He thought that was the right spirit, although it could not, of course, be done in every case.

MR. J. M. THEOBALD, F.S.I., responding for the surveyors, made a humorous speech, in which many professional terms were introduced in outlining the "history" of a quantity surveyor, in the course of which he said: Once upon a time there was a young Quantity Surveyor, whose Christian name was William—naturally enough he was called "Bill"—who led the usual monotonous life, with "Variations," of course. He came of "good, hard, sound, well-burnt stock," and though handicapped by a "plain face," a "bull nose" and a "rough squint," his "frame" was "free from sap, shakes, large, loose or dead knots, waney edges and all other defects," and he was as "Keene" as cement. He committed many sins of "addition and omission" (which he endeavoured to cover up before they had been inspected and approved by the architect), and he was not above being "squared"; but for this his father, who had spared the "rod" and spoilt the "reinforcement," was largely to blame. "Anaglypta," however, upon whom his affections were "centred," (centering measured separately), was not blind to his many faults. . . . She pointed out to him that he was "oversailing" the mark and that six months' (tread-) "milled lead and labour" would surely be his, although she realised he was so weak that "no solution" was possible—not even "Dr. Angus Smith's." Of this she was so "shore" that she "struck and removed him as being no longer required," as he found to his "prime cost." This completely "floored" him and the "asphalte flat." That night as he wended his steps "fair on top and front edge" and "lay on his natural bed," which "rubbed hard on all his exposed surfaces," he felt he had indeed "floated grounds" for complaint. A bad attack of "flu," which, in spite of being "parged and cored," "caused distinct signs of shrinkage to appear within three months," warned him that his die was "cast (including mold)." He therefore "gave notice to the local authority," but his "submission was held not to be one within the meaning of the Arbitration Act of 1889," so he was "executed and carried out in accordance with the R.I.B.A. Conditions of Contract." A "trench was dug, not exceeding 5 ft. deep," as per the standard Method of Measurement, into which he was "filled in and well rammed," and having thus paid the "penalty" and made "provision" of quite respectable dimensions for a quantity surveyor—to which, of course, the legatees had to "add for profit, carriage and fixing,"—his character was held to have been "twice whitened."

In proposing the toast of "The London Master Builders' Association," VISCOUNT BURNHAM said hardly a day passed but what a new building material was put forward as a solution of all the building difficulties by someone unconnected with the industry; it seemed to be thought that those who understood the art of building most completely were those who had never learned or practised it. It had to be remembered, however, that building materials suitable for one country were not necessarily appropriate to another country with different climatic and other conditions. He used to think that the architects and builders of this country used materials and built in the style most suited to the character of the country, but that seemed to be wrong, and it appeared that if building was to be carried out according to the best principles it would be necessary to revive the office of the Minister of Munitions. It was sometimes thought that architects and builders to-day were never able to equal the standards of ancient days, but lately—especially after seeing such work as that of Mr. Herbert Baker, A.R.A., in South Africa—he had come to the conclusion that that was a myth. It would be impossible to find craftsmen of greater skill or reliability than the men who, selected from the staffs of London builders, had gone out to Delhi to give their lead to the native workmen who were building there the new capital of India. In the L.M.B.A. they had the organised strength and the organised efficiency of their calling, and also the organised patriotism of their calling. In his address from the Throne the King had called attention to the necessity of properly housing the people and clearing slum areas in order to promote social contentment and alleviate human misery, and with the return to confidence brought about by the change of Government came added responsibilities. If the years immediately before them passed without an effort to make it impossible for the present housing scandal to continue, then indeed they would have a heavy reckoning to pay. The housing inadequacy was at the root of social discontents, and unless they dealt with the problem satisfactorily, the prospect before them was not a very bright or hopeful one. Instead of this period of confidence being a time for them to rest, it was their duty to get busy and make certain that in a few years all that

they now deplored in the overcrowding of cities, in lack of cleanliness and comfort in the villages, would be a thing of the past. As master builders they more than anyone else could help to attain that consummation, and he was confident such an appeal would not be made in vain.

The PRESIDENT, in reply, said the year now closing had been the most eventful one in the history of the Association. At its outset they had the shadow of a dispute hanging over them, and at Liverpool there was an attempt to undermine the national agreement. Then there came a demand for 2d. an hour increase in wages throughout the country, and the situation was rendered more difficult by the serious shortage of labour in certain skilled trades. The federated employers felt bound to resist the demand, although the London employers had no reasonable objection to an advance in wages in their own area, but the Association was not prepared to see the grievances which undoubtedly existed in London made use of to force up wages all over the country, in many parts of which no advance was justified. The employers made the most strenuous efforts at conciliation, and went to great lengths to avert the trouble. A national strike in the building industry of this country was without precedent, but it had one merit—it was short and sharp, and when work was resumed it was on terms which were practically the same as those offered when the negotiations were continued. Liverpool had been brought into line, and the London employers had been given the opportunity of increasing the wages of their own men without prejudicing the national position. They were proud to know that in all these difficulties and in all their activities they had emerged with a great measure of success and with much increased prestige. Their success had been earned by the whole-hearted loyalty of the members of the Association, and particularly of the members of the Council and Committee. They must now look to the future, and it was more necessary than ever before that they should have a strong, united employers' organisation to control the industry and to legislate for its future peace and well-being. The greatest difficulty to-day was undoubtedly in the shortage of their skilled trades. Unless the employers were federated they would be bidding against each other, there would be an all-round increase of wages, and the result in the end would be ruin and chaos in the industry, and the trade unions would be in absolute control. In the interests of the nation that could never be allowed. They must have an immediate increase in the number of skilled men, and that could only be obtained by increased, intensive apprenticeship, and for the time being a rigid adherence to the standard rate of wages. They were going to ask every employer, in and out of the Association, to give a signed undertaking that he would pay neither more nor less to his workmen than the standard rate. He was not one of those who believed that the bare standard, the flat rate of pay to all workmen, was the ultimate aim of their policy. He believed in paying a man what he was worth. He believed the time would come, though it might not yet be near, when the highly skilled man in the industry and the man who was prepared to give a better output than his fellows would have a higher reward. Unless they could bring that about they would never get men to give of their best. Nevertheless, they were convinced that, for the time being at any rate, and until other things had been put right, the bare standard of the agreed rates must be adhered to. If firms failed to carry out their undertaking then they would have to bring against them the full strength of their organisation. Architects, surveyors, and builders should have no difficulty whatever in deciding where their support should lie in this matter. They desired to lift their industry to a much higher level than it occupied at present. It was not part of their policy to fix prices or to limit fair competition. There was nothing whatever in their objects, either written or unwritten, which would lend colour to the suggestion that they were forming a ring.

The toast of the guests was proposed by MR. FRED THORNE, and acknowledged in a few words by MR. E. J. RIMMER.

THE HEALTH MINISTER AND HOUSING

BY B. S. TOWNROE.

MR. NEVILLE CHAMBERLAIN during the past fortnight has made several interesting speeches, mainly to political gatherings in London, on housing problems, but his pronouncements have been somewhat lacking in illumination. He has spoken, as might indeed have been expected, with a certain complacency on the results of the 1923 Act, and has announced the record number of houses, probably in all over 120,000, that will have been built since January by the end of this month. He has also said a good deal in the abstract about steel houses, and declares that he has been "very favourably" impressed after seeing for himself the Weir house in Glasgow.

Mr. Chamberlain has an exceptional opportunity. For this reason it is possibly permissible to write somewhat frankly of his immediate tasks. All thinking people wish him well in his new post. He has been favoured with an exceptionally good press because, so it has been freely stated by inspired political correspondents, he refused to become Chancellor of the Exchequer, as he wanted to make his mark in housing. Ever since the Election all men, even his political opponents, have spoken well of him. Here lies the danger, and it is because of this that all those who are keenly interested in the provision of houses and the clearance of slums must hope that Mr. Chamberlain in the near future will devote himself a little more clearly to some of the difficult conundrums in front of him.

He has, I believe, expressed admiration for the Weir "steel" house, but Lord Weir in a letter to me, dated November 10th, just over a month ago, spoke of his method as being in an initial stage of development, and expressed his anxiety that it should not go out as "a half-baked scheme." The report of the Committee, of which Sir Ernest Moir is chairman, on the Weir house, issued last month, was a masterpiece of official ambiguity, saying as little as possible for or against. But those who have studied the report carefully know that serious objection will be taken to the Weir house unless the measures proposed to keep it warm and to resist high temperature are successful; and are aware that the scantlings have to be increased and the internal linings strengthened; that from the architects' point of view the monotony of the types is a disadvantage; that certainly "the life of the houses will be shorter and the maintenance charges will be greater than in either a brick or concrete structure"; and that no exact figures are available on the essential question of cost. In short, reading between the lines of the Committee's report, it is obvious that the signatories do not expect the Weir house to revolutionise the building industry.

It is, of course, well-known in the trade that the upgrading of builders' labourers is a right course, and that the trade unions have in the past raised many difficulties. It is equally well-known that in recent months there has been a very steady and satisfactory recruitment of the ranks of skilled craftsmen by men who have had plenty of experience as labourers on building work. But there is a fear that the speeches of politicians may check the healthy movement within the industry itself.

It is stated that the Wheatley Act is breaking down of its own weight. There are many who have an objection to Mr. Wheatley as a politician, especially in view of his recent calls for class warfare, but who recognise that his Act of 1924, despite imperfections, has many good points. Local authorities are, in many cases, being forced by the facts to change over from the Chamberlain Act to the Wheatley Act. A subsidy of £9 for forty years as against £6 for twenty years, in spite of limitations of rent, has an appeal that cannot be resisted. Many architects who would certainly advise a private client, whether he be a man wanting a house for his own occupation or a builder, to proceed under the Chamberlain Act, are finding that the situation is quite different when the deal with local authorities.

On this point a clear statement i needed. Local authorities who are sidering housing schemes for next y definite statement as to whether intention of the Government to facili under the Wheatley Act, or whether it is to remain in force on the Statute to be killed in effect by administrativ

Again, the nation will expect a early next year with regard to slum Sir Leslie Scott, in a notable speech Parliament on December 9, suggested time has come to give advances for ment of insanitary property up to 75 of the annual loss incurred by a local and possibly also to make a capit bution at the outset.

It is too early yet for any consider to be announced with regard to the of town planning to areas already Obviously the 1919 Act that applies co as far as areas are to be built over in are concerned, needs expansion. that Mr. Neville Chamberlain is th sympathetic on this point, and there a hopes of a move forward in town plan year.

These various points of view are n in any spirit of hostility, and certain opposition to the Government's declar of helping the private builder and of ing house ownership. But there is the present time that some of the rea the situation may be overlooked. The press especially cannot ignore the i feeling that exists, especially among and builders, that politicians, irrespectiv party complexion, are too apt to ove practical questions involved. Wild mistic statements about "steel" exaggerated claims as to "dilution hits at rival housing schemes, do n help the nation forward. Mr. Cha to-day should realise that he has an ex opportunity, because he now posse confidence of probably nine-tenths of t and that it will be a disaster if he fails good his present confidence.

[The above article was written be discussion in the House of Commons day.—ED.]

BUILDING IN LEE

A REPORT of the building activity during the past year has recently been i the City Engineer (Mr. W. T. Lancashi comparative table of the number o erected is as follows:—

	Dec. 1923 to Nov. 1924.
Detached houses	105
Semi-detached houses ..	299
Terrace houses	350
Total houses	754

The miscellaneous buildings erected the past year numbered 1,037, as c with 963 the previous year; plans de numbered 2,255, as against 2,221, and mated value of buildings shown on the a plans was £1,505,084, as compare £1,587,656.

Under the Housing Act, 1923, the Cor has approved applications for the ere 975 houses, provisional certificates ha issued for 543 houses, and there are to completed. In addition 200 houses a erected for sale by the Leeds Corpor Middleton under the 1923 Act. The tion now propose to obtain tenders erection of 500 houses at Crossgates, Me and Middleton. Under the Leeds schemes 1,563 A type houses have be pleted, 1,288 B type completed, 41 completed, and 337 C type completed, a 3,229. A further 100 houses are completion.

LONDON ASSOCIATION OF MASTER DECORATORS

THE CRACE PAPERS.

IE presentation of prizes to successful lon competitors in the recent competitions nised by The National Painters' and rators' Joint Education Committee at castle-on-Tyne, took place recently at ters' Hall, Little Trinity-lane, E.C. Prior ie distribution Mr. A. V. Sugden (Chairman xecutive of Wall-paper Manufacturers, Ltd.), in a condensed form "The Crace Papers." Sugden said the papers themselves were in the nature of classics and were full atters of great literary as well as of anti- ian interest. John Gregory Crace, was in 1809, and came of an old family of rators and paper-stainers (for in the early the two arts were generally combined), and family was one of extreme personal longevity. 826 John Gregory Crace joined the firm and tly afterwards they established themselves Wigmore-street. John Gregory Crace elled abroad and became a recognised iority on decorative art. It did not seem able that paperstaining was actually carried by the Craces from about 1800 onwards, but had an excellent range of private designs h passed into the hands of Cowtan & Sons 99, when the latter house acquired the Crace ness.

ie two papers, which the lecturer then in an abbreviated form, were delivered February 4 and 18, 1839, to the Royal itute of British Architects. After reading papers Mr. Sugden made the following ments :—

RIGINS.—Whilst it was entirely correct that e of the earliest efforts, as also those of later ods, had been aimed at the imitations of the stries, velvets, oak wainscoting and leather gings of earlier ages, it was also on record the earliest known specimen of wall-paper this country—the so-called "Cambridge ment" of 1509—was printed by an early rpress printer, Hugo Goss, of Beverley and k, in the ordinary black printer's ink of the od. It would seem that in this country at rate the letterpress printers manufactured -papers even earlier than the paperstainers er, who invented the flock and also the domino rs. His theory was that these letterpress ers when time or inclination permitted did only make papers for walls, but closet and g papers and papers for the interior of ks and chests. It was even possible that e of their ornamental scrolls and similar work, normally in book plates, surrounding of lamations, &c., were actually suitable and for those purposes.

LOCK PAPERS.—Apropos of the invention of k, claimed by Francois of Rouen, prior to its oduction by Jerome Lanyer, modern research the credit of the discovery to Holland and n fully half a century earlier than Francois. what it was worth he advanced the theory Jerome Lanyer (or Lanier) might have been uguenot refugee who had fled from Rouen might have been a workman under Francois nally. His name Lanyer may have been an ish version of the French "lainier," or er, viz., Jerome the Flocker. The French hs for Francois were difficult of credence (1) use in the French description of flocking, ed by Crace, no blocks were used, the artist ting his design in fixitive directly on to the rial used (this would suggest the blocks ing the dates 1620 were really domino ks), and (2) because the facts and dates ed about him must be wrong, as a father was a fully-grown individual in 1620 could ly have a son who died in 1748! It was rkable that the flock ran for a very con- able period before it occurred to its prac- ners to utilise their designs and blocks for ur printing.

OMINO PAPERS.—These originated in Italy with the marbled paper of a type and process of manufacture so well known in connection with ledger linings. The art proceeded to France, and in that country at least the printers, with their little domino blocks, were the direct forerunners of paperstaining proper. Domino papers did not appear to have ever been manufactured in England, but there was a considerable affinity between these and the chest lining papers.

JACKSON OF BATTERSEA.—The references quoted from this essay (by Crace) showed him to be critical not only of all rival productions, including Chinese, but also of his own earlier distemper printed papers. His use of oil colours marked a great departure from general practice and his blends were quite clever. He used four colours—grey-green, yellow, blue and red—and claimed "ten positive tints." Specimens of his work might be seen in the Print Room at the British Museum and also at South Kensington. He was evidently a father of modern advertising.

THE CHINESE PAPERS.—These may be divided into three groups—(1) the original hand-painted Chinese, imported by London traders, which consisted of scenic subjects, each length different and designed to grow up the wall from base to ceiling; (2) the English imitations, which were nearly all in small panel form, like pictures, usually printed in outline from an engraved or etched plate with the colours put in by hand; and (3) the French imitations which were more ambitious and also more grotesque in subject, such as mandarins skipping on trees, &c. It was probable that Jackson's contempt was aimed at the two latter classes. Some very good specimens of the English Chinese were contained in the Joicey collections at the London Museum. There were also one or two at South Kensington.

THE ECKHARDTS AND SHERRINGHAM.—It was regrettable that so little of these eulogised paper-stainers was known and that their work had also passed into oblivion. Nathaniel Hinchliffe, forerunner to Scott Cuthbertson, took over the Whitelands works at Chelsea previously in the occupation of the Eckhardts, whilst the first William Woollams was apprenticed to Sherringham.

THE PASSING OF SUPREMACY TO THE FRENCH.—It seemed extremely probable that this was due in part to the coming of machinery which not only monopolised the attention of those who were experimenting with it, but disturbed the normal initiative of those who did not understand and possibly over-estimated its effect on hand-work. It must be admitted, however, that the imitation of other and costlier materials had always been most prejudicial to the development of design, and it would seem the French were rightly seeking originality and a form of expression in design which really suited the material upon which they were working.

STENCILLING.—This process, which appeared to have fallen into disuse about Crace's time was revived some forty years later by the firm of Messrs. Hayward & Son, and had been a very important branch ever since.

CRACE'S CONCLUDING WORDS AS TO A HIGHER STANDARD OF DESIGN AND TASTE.—"It appears presumption in one so humble as myself to address thus the Institute of British Architects, but yet with them in a certain degree must rest the remedy. It is in your power to introduce in your designs the Sister Art of Painting; by encouraging that, the evils of which I complain would soon disappear, working schools, the only effective ones, would thus be formed, and besides adorning our buildings, you would be the means of more widely diffusing and perfecting an art, which I think all will agree is of such vital consequence to the grand cause of our greatness as a nation—our manufactures."

Whether it be to his inspiration or not, it was clear that after these words an immense change came over the scene, commencing a very few years from the date of the Crace papers. To mention the factors in sequence and very briefly, he would quote the following events :—

(1) The Gothic Revival pioneered by Owen Jones and Pugin.

(2) Metford Warner's determined efforts to bring wall-paper up to the level of the arts. This effort was an almost unique achievement in its length of performance as in the success which crowned it. A feature was the seeking out of the artist by the manufacturer instead of depending on the block-cutter for his designs.

(3) The coming of William Morris and the pre-Raphaelites, Walter Crane, Lewis Day, C. F. A. Voysey, and others.

In conclusion the lecturer showed a number of papers of the Crace period, some being actually designs of the firm and possibly printed at one time under the personal supervision or to the order of the author of the papers.

After a cordial vote of thanks had been passed to Mr Sugden, the prizes and certificates were awarded to the successful competitors.

BUILDING TRADE APPRENTICES

IN view of the recent visit to the Minister of Health of a deputation from the National House Building Committee on the question of augmenting the supply of labour in the building industry, it may be of interest to recall the methods of popularising the trade with the young men and boys of Ipswich in 1922. There it was felt desirable and necessary for the apprentices to make full use of the evening classes at the technical school and the school of art, and it was discovered that for some reason, whilst other courses of instruction were well attended, that on building construction was not. With a view to altering this state of affairs, two "socials," at an appreciable interval apart, were held. The interval of the evening's entertainment was made use of for short speeches urging the opportunities of the training afforded. At the second social a similar procedure was adopted, and, in addition, a letter setting out the scheme of training was handed to each boy, asking him to consider the matter for another week. A satisfactory result ensued, and the building trade instruction at the evening classes was an assured success.

The same plan, it is felt, might well be adopted very generally; but at the same time it leaves something still to be done. "The boys," writes a correspondent, "must have practical training as well as theoretical; and herein is the opportunity for the employers. The old-time objection that one employer does not care to train apprentices who leave him upon completion of the term to go, perhaps, to a competitor may be overcome by means of grouping all apprentices together under experienced instructors; but these groups should not be kept continuously under the same employer, it being rather the care of the local Association of Master Builders to find work for the groups. The cost being thus borne by the local association, the share falling upon the individual employer would be slight. Nevertheless, whatever system be decided upon—and that reported in *The Builder* of December 5 would seem to be as satisfactory as any—it will be essential that the course must be intensified. The need is urgent; the shortage is now, and training lasting from three to five years, whilst being better than nothing, will not supply that need. Given proper care in instruction and application on the part of the student, and also advanced continuation classes for as long as may be desired afterwards, there is no great difficulty in the way of making a craftsman sufficiently capable to undertake any of the operations required in erecting a cheap house such as will be necessary in six months."

NEW BUILDINGS IN LONDON

Charles-street.—A large block of flats is in course of erection at No. 12, Charles-street, the former town house of Lord Savile. The site extends from Charles-street to a private road in the rear, and the building will consist of seven stories, containing two large suites on each floor, with lounge hall, two reception rooms and from three to six bedrooms, in addition to ample kitchen offices, grouped round a central court-yard. The construction will be fire-resisting throughout, and the Georgian elevation will be in Crowborough bricks with stucco cornices and enrichments in keeping with the general architectural character of the street. The building is being erected for the London and Northern Estates Co., Ltd., from designs by Mr. Paul Hoffmann, architect, Capel House, E.C.2. The general contractors are Messrs. W. H. Lorden & Son, Ltd., of Upper Tooting; the steel engineers, Messrs. Young & Co.; lifts by The Express Lift Co.; heating and hot-water installation by Messrs. Russell.

New Oxford-street.—The large five-story corner block of premises known as No. 78, New Oxford-street, W.1, is to be considerably altered and renovated and opened as office accommodation. Shops will be fitted in the ground floor, whilst the remaining floors will be sub-divided as required. A lift will be installed. The work has been entrusted to Messrs. Whitby's, Ltd., Eagle-street, London, W.C.1. The architects are Messrs. Nicholas & Dixon-Spain, of 19, Hanover-square, London, W.1.

Old Broad-street.—Alterations and improvements are to be made to the premises in Old Broad-street, E.C., of the Midland Bank, Ltd. Plans have been prepared by Messrs. Whinney, Son, & Austen Hall, of 8, Old Jewry, Cheapside, E.C.2. The contractors are Messrs. Hall, Beddall & Co., Ltd., of Waterloo Bridge, S.E.1.

Cheapside.—A new branch shop is to be opened by Messrs. Horne Bros., Ltd., of 90, Oxford-street, W.1, at premises in Cheapside, E.C. The new shop front, &c., will be carried out by Messrs. E. Pollard & Co., Ltd., of St. John's-square, London, E.C.1.

Walworth-road.—It is proposed to considerably alter and improve the King's Head Hotel, in Walworth-road, Newington, S.E., owned by Messrs. Watney, Combe, Reid & Co., Ltd., of the Stag Brewery, S.W.1. A new front, probably in terra-cotta, will be built and the heating and lighting systems improved. The architect is Mr. Malcolm T. Saunders.

Edgware.—A new branch bank is to be built at the corner of Edgwarebury and Hall-lane by the Westminster Bank, Ltd., of Lothbury, E.C. The new building will be of three floors, of which the ground floor will be used for the bank and the upper stories for residential purposes. The building will be faced with best Crowborough bricks, with quoins and stringers of red pressed brick. The elevation to first story will be of Portland stone with metal windows. Central heating and electric lighting will be installed. The contractor is Mr. Harry Neal, of Northwood, Middlesex. The architects are Messrs. Hall-Jones & Dewhirst, of Parliament Mansions, Victoria-street, London, S.W.1., and Ealing, W.

Regent-street.—Building will start shortly on the site of Nos. 83–89, Regent-street, W.1, where the old buildings are to be replaced under the scheme of the Office of Woods and Forests. A building lease for 80 years has been granted and plans for a new block of office and shop property have been designed by Messrs. Trehearne & Norman, of Windsor House, Kingsway, London, W.C.2. The new building will be of six stories, with basements, and will have the top floor in a Mansard roof. The elevation will be similar to the adjoining buildings, and will be of Portland stone enriched with bronze ornamental work. The shop fronts will also be of metal work, and the remaining casements will be of the steel type. The roof will be covered with green Cumberland slates, and finished on the top with concrete and asphalte. Lifts will be installed to serve all floors, and central heating, electric lighting, bells, and burglar alarms, ventilating plant, vacuum cleaners, &c., will form part of the equipment of the building. Marble will be used both for the window linings and skirting, and for the entrance lobbies floors and walls. The contractors are Messrs. W. F. Blay, Ltd., of Dowgate-hill, Cannon-street, London, E.C.4, and Spital-street, Dartford, Kent.

Jeffrey-road.—Alterations and additions are to be made to the "Clarence Hotel," at Jeffrey-road, S.W.4. The work will cost several thousand pounds, and will principally consist of new kitchen and lavatories, a re-arrangement of the interior fittings and the provision of a new front to the building, probably of terra-cotta. The plans have been prepared by Mr. Foster, chief surveyor to the Nine Elms Brewery, S.W.8.

Edgware-road.—The premises at No. 229, Edgware-road, W., are to be demolished and a new business emporium erected for occupation by Messrs. Montague Burton, Ltd. This firm are to build premises of four stories. The building will be erected on a steel-framework, and will have a frontage to the street clothed in Portland stone. The floors will all be of concrete, surfaced with wood blocks. The roof will be slated. Heating and hot-water supplies installations and electric lighting will be installed The architect is Mr. Harry Wilson, of Victoria Park-avenue, Kirkstall, Leeds.

St. Helen's-place.—Another site in St. Helen's-place is to be covered with an office building, similar to the new building on the site opposite. The new block will be of six stories in height with a basement. The street elevation will be carried out in Portland stone, and the rear wall will be backed with white glazed brick. A steel frame will support the building, the floors being of concrete. The window casements will be of steel, a lift will be installed, whilst the interior equipment will also include heating and electric lighting, ventilating plant, vacuum cleaning apparatus, telephones, bells, &c. The entrance and lobby will be paved and walled in marble. The contractors will be Messrs. Dove Bros., Ltd., of Cloudesley-place, Islington, London, N.1. The architect is Mr. Henry A. Saul, F.R.I.B.A., of 10, Gray's Inn-square, London, W.C.

Wood-street.—Work has just started on a new block of residential flats to designs of Mr. Matthew J. Dawson, F.R.I.B.A., of 9, New-square, Lincoln's Inn, London, W.C. A block of six stories is to be erected containing three flats on each floor. The building will be steel-framed, with side walls of brick and a front elevation of facing bricks and Portland stone dressings. The floors will all be of concrete, reinforced with steel bars. The roof will be flat and asphalted. The builders are Messrs. Ford & Walton, Ltd., of 254, High-road, London, N.W.6., whose tender amounted to £36,890. The steelwork will be supplied by Messrs. Redpath, Brown & Co., Ltd., of 3, Lawrence Pountney Hill, E.C.3. The site has an area of 5,450 ft. with a frontage to Wood-street of 40 ft.

Deptford.—Tenders will be invited at an early date for the erection of public baths and wash-houses in Evelyn-road, North Deptford, for the Deptford Borough Council. The plans show two swimming baths 66 ft. long and 22 ft. wide. in concrete, around which will be 38 dressing boxes. There will also be four suites of slipper baths, and vapour baths, cooling rooms, shampooing room and two shower baths. There will also be a public laundry, boiler house, stores and residential quarters for a caretaker. The total cost of the scheme is estimated at £72,000. The architects are Messrs. A. W. S. & K. M. B. Cross, of 45–46, New Bond-street, London, W.1. The quantity surveyors are Messrs. Rualt & Young, of 17, Southampton-street, London, W.C.1.

Langham-place.—A new block of offices—to be called Summit House—is to be erected on the site of Nos. 1 and 2, Langham-place, W.1, at the corner of Langham-place and Mortimer-street. The ground floor will provide space for a bank on the corner, with shops on each street front. Above will be five upper floors divided off for letting purposes into suit single offices, reached by a lift from the floor. Electric light will be installed, current will also be supplied for power pu A central heating hot-water supply on t pressure system will also be included floors will be of concrete supported by grillage, which in turn will be suppor girders and stanchions. The elevations streets will be of Portland stone. Wooc flooring will be laid on the ground flo entrance hall. The walls will be of p plaster, plainly distempered. The roof covered with slates. The site has a fr to Mortimer-street of 28 ft. and to Lar place of 45 ft. The ground floor area is whilst there will be a basement, light pavement lights, of 2,000 ft. The archi Mr. Delissa Joseph, F.R.I.B.A., of 2, Basi avenue, London, E.C.2. The builders are Edcaster, Ltd., of Goldhawk-road, Shep Bush, W.

Regent-street.—Messrs. A. Edmonds Ltd., are the contractors for shopfitting at the new premises at 149–151, Regent-

BUILDING MATERIAL DEPUTATION

THE Minister of Health, the Right Neville Chamberlain, accompanied b Parliamentary Secretary and officials Department, received a deputation fro manufacturers and suppliers of bu materials.

Mr. H. J. C. Johnston, on behalf deputation, said that the Minister coul on the hearty co-operation of the ma turers in the Government's housing sc They had given their word that they not increase prices of building materi housing schemes unless increases wer dered necessary owing to increased co production; the record of the past few m had shown that the materials manufac and suppliers were keeping their word. manufacturers objected to being single for control by Act of Parliament, as ha intended by Mr. Wheatley, and had st expressed themselves as opposed in pr to the Building Materials (Charges Supply) Bill. The manufacturers refer the fact that although there may be a sh of bricks in some areas, there were, other hand, several districts in which th duction exceeded the demand, and strongly urged that some means shou devised whereby these surplus stocks co economically transferred to the needy

The Minister, replying to the depu said that he accepted their promise of co tion, and he was sure they all realise what would pay them best would be tinuous demand for their commodities. could best be secured by maintaining pr the lowest possible level. He welcomed promise to set up a committee wh thought would have many useful functi perform with regard to the distributio the most advantageous use of av materials, so that a shortage in one could be supplied out of an excess in a district. He promised to send the ma turers a draft of the precise terms of ref for their committee so that its functions be settled quite definitely.

Concrete House Subsidy.

The Ministry of Health recently decid important point in connection with co houses and the subsidy. The Chertsey District Council wrote to the Ministry ask concrete houses would be eligible for the su and if the £75 subsidy was to be calculated £600 cost limit for houses available f subsidy. At a recent meeting of the Cou was reported that the Ministry had decide concrete houses erected at a cost of £62 brick at £675, were available for the su which is included in these amounts.

CATION IN THE DING INDUSTRY,

LIVERPOOL CORRESPONDENT.]

tional development of vital interest ing industry is taking very definite verpool. On January 5 next a new of day classes for apprentices in the dustry will be established in the nical School, and additional accom- ill shortly be available in the Lord morial Workshops, Fontenoy-street, chased by the Education Committee ustees.

me is the outcome of several confer- under the chairmanship of Mr. J. Allen, M.P., between members of the nd Allied Trades Employers' Asso- Operatives' Societies, and representa- Technical Education Sub-Committee Education Committee. It is under- an Advisory Committee consisting of f these several bodies will form a part of the machinery responsible for on of the scheme, and for the success artment.

ous approval has been secured for the nich provides, in the first instance, for nce at a two years' course, of appren- ed in the various trades comprising ng Industry. Apprentices will be ithout loss of wages, on one full day in order that they may attend the ses arranged for their sole benefit at of Building. In addition to attend- g the day, the apprentices will be to attend on one evening each week, trated lectures dealing historically tlines of building construction, types nd machine tools, and the uses and of materials will be delivered by ing special knowledge of the industry sential needs of both apprentices and

g on the two years spent in the day e youths will continue for a further t more advanced evening classes, and complete, during the apprenticeship omprehensive course of study extend- least four years.

such as this, supported as it is by all with the future prosperity of the ndustry, should exercise a profound cial influence, not only on the appren- oblem, but also on the whole of the ndustry in the locality of Liverpool. ts no longer any doubt regarding the of the old-fashioned indentured ship system. So ineffective has it t only a very small proportion of the on employed in the skilled building e served, compulsorily, an apprentice- l. The Industry has been in recent ansformed by the employment of new onal materials and methods, and of hinery, that the old-style apprentice- ods have ceased automatically to

fresh from school on entry to the ndustry is no longer employed as an to a master, but he has become to a t an independent worker in a vast economically important but relatively pations. The large machine-driven s gradually displaced the small shop, was usual for the apprentice to be d educated for the career of an all- aftsman. The conditions which possible for the master or his journey- e to the apprentice personal attention ng in the usages of his craft have thus surely disappeared. That personal necessary for the cultivation of really craftsmen is, by force of circumstances, king in the modern workshop.

of those responsible for this Liverpool Building is not merely to provide facilities for apprentices to acquire a of the technique of building con- forms and methods, but also to m to take a wide view of their craft.

ACTION BY CONTRACTORS

THIS case came before Mr. Justice Roche in the King's Bench Division on December 5, upon a special case stated by the arbitrator in a dispute between the plaintiffs—Messrs. Wm. Muirhead, Macdonald, Wilson & Co., Ltd.—and the Corporation of the City of London in regard to a housing scheme at Ilford, which was, it was alleged, to cost about £2,000,000. The scheme was abandoned when only 220 houses had been erected.

Sir John Simon, K.C., Mr. A. A. Hudson, K.C., Mr. W. W. Szlumper, and Mr. L. Mead appeared for the contractors; and Mr. Alexander Neilson, K.C., and Mr. E. H. Tindal Atkinson represented the Corporation.

Sir John Simon stated there were two contracts—a building or housing contract dated July 1, 1920, and a road and sewers contract dated August 6, 1920. The Corporation's scheme was for the erection of not more than 2,000 houses. The payment clause was of a very intricate nature, and one which the Ministry of Health must more or less have patented. Its object was to secure that the contractors would get a defined remuneration per house. If the contractors brought out a house at less than the standard price their profit was increased, and if a house cost more than the standard price the contractor's profit was reduced. In any event, there was a guaranteed profit of £30 per house to the contractors. He (Counsel) contended there was an implied term that the Corporation would not so behave as to make the houses cost more than the standard price, which would penalise the contractors. When the scheme was abandoned, only 220 houses had been erected and the foundations of 414 houses laid. There was a big bill to foot, and the question was: What was the size of the bill? The Corporation had power to give notice to suspend or put an end to further work, and in that event the contractors were to be paid for what they had done. The Corporation relied on a provision that they were at liberty to say "stop," and they also said they were only liable to pay a sum per house. The houses had cost more than the contract price, and the contractors' profit had been reduced to the minimum. By the breaking of the contract by the Corporation the contractors had sustained a great loss, because they had provided heavy plant and had given orders for bricks. A portion of the site had been taken out of the contractors' hands and let to a farmer. It was said by the contractors that the Corporation, by what they had done, had greatly increased the cost per house, and that they were not entitled now to say their liability was limited to the terms of the contract, which, if literally interpreted, would give but a minimum profit per house to the contractors.

The arbitrator had found entirely in favour of the contractors, and the question now was how the facts had to be applied and whether the contractors were to be paid the price per house under the contract or a larger sum as damages.

Mr. Neilson, for the Corporation, said the Ministry of Health was responsible for all the steps the Corporation had taken. There was to be a penny rate on the City, and any sum required above that for the scheme was to be found by the Ministry of Health. Because of the urgent public necessity for economy, steps had to be taken to stop the building of the houses. The number of houses to be erected, he (counsel) submitted, was entirely in the control of the Corporation, who could go to the contractors, after one or two houses were built, and say they would not want any more. The cost of materials and plant, except certain specific portions, had to be paid for by the Corporation.

Mr. Justice Roche, in giving judgment, said that when prices were mounting in an alarming way the Corporation ordered the contractors to "go slow," and they did everything they could to prevent progress of the work. He thought they should make up the loss resulting from that circumstance to the contractor. It was a necessary implication of a contract of that kind that one of the parties to it should not so act as to prevent the other earning a reasonable profit. He accordingly held that the contractors were entitled to £40,766 in respect of the housing contract and £9,175 in respect of the roads and sewers contract, and he entered judgment accordingly for the contractors for those sums with costs.

DARLINGTON MASTER BUILDERS' ASSOCIATION

THE annual dinner of the Darlington and District Master Builders' and Allied Trades Association was recently held at the King's Head Hotel, Darlington. Mr. C. J. Todd (President) occupied the chair, and those present included Mr. G. C. Carr, President of the Newcastle Association; Mr. H. Bell, senior Vice-President, Northern Counties Federation of Building Trades' Employers; Mr. W. H. Hope, Secretary of the Northern Counties Federation; Alderman T. E. B. Bates, Chairman of the Darlington Corporation Housing Committee; Mr. J. W. Guthrie, junior Vice-President of the Darlington Association; Mr. W. Stairmand, Past President, Northern Counties Federation, and member of the National Conciliation Board.

Proposing the toast, "The Building Industry," the Chairman said he had been associated with the trade for 29 years. Some people urged that dilution was the solution of the housing problem, but in his opinion the foundation of the security of their trade in the future was to be achieved by making their own workmen by training apprentices. He had always favoured such a course of action, and he found that other employers were always glad to get hold of his apprentices.

Responding, Mr. Carr agreed that they would never be able to build the houses required until such times as they got more men. He mentioned that a scheme had been inaugurated in Newcastle under which they could take apprentices to bricklaying and plastering from 18 to 22 years of age, and they could become fairly skilled in two to three years.

Mr. Bell said that if they were to build houses at a reasonable figure several factors must be more favourable than they were at present. The first was labour, which had gone back 50 per cent. in output. If they could get it into the minds of the workmen that they were not only helping the employer, but doing a good turn to themselves and to the nation by increasing output they would go far towards solving the problem. Replying to the toast, "Success to the town and trade of Darlington," Mr. Minors, Borough Surveyor, paid a compliment to the way in which the builders of the town had risen to the occasion. He said that during the past twelve months 235 houses had been certified for occupation, or about 40 to 50 more than the average before the war.

Concrete Mile Posts.

Concrete mile posts and whistles are very generally used on railways on account of their low initial cost and the negligible cost of maintenance. A further development in this direction is now being made by the use of white cement for the manufacture of these posts, which considerably adds to their visibility. On one important American railway, the New York Central Railroad, all mile posts and whistle posts are now made with white cement. The posts are made in wooden moulds, the "W" on the whistle posts being formed by nailing strips of wood inside the forms; they are then painted black. The concrete consists of 1 part "Atlas White" cement, 2 parts white sand, and 4 parts white gravel passing a ¾ in. mesh. Both types of post are reinforced with ½ in. round rods.

NOTTINGHAM BUILDING TRADES' EMPLOYERS

THE annual dinner of the Nottingham and District Association of Building Trades Employers was recently held at the Victoria Station Hotel, Nottingham under the presidency of Mr. P. Bow.

Mr. W. Bosworth, in proposing the civic toast, said Nottingham was a city of splendid enterprise. He referred to housing, the new Town Hall, Wollaton Hall, the Municipal orchestra, the widening of Trent Bridge, and the electricity station. Nottingham, he said, could not be much behind in its endeavours on behalf of the citizens. It seemed a pity that some of the unemployed could not be usefully employed in the erection of houses. Their federation was not to blame for the shortage of labour in the building trade. As a matter of fact, they had been opposed in this matter to a very high degree.

In responding, the Mayor mentioned that the 1,500 houses erected by the Corporation cost about £1,000 each. The Council now projected the provision of another 700 at a cost which would work out at £500 per house. People required houses at a rent they could pay, and unless they were able to build cheaper dwellings they would not benefit the community at large. He suggested that, say, 50,000 men in the army should be trained in building trades so that when they came out of the service they could take their place in the building world. It would be a good investment for the nation, and they would do no harm whatever to the present bricklayers, plasterers, &c. What they wanted were more skilled men, and he thought it was due to the country to provide them.

The Sheriff (Councillor R. A. Young), who also acknowledged the toast, observed that he inclined to the view that they were suffering somewhat from the sins of their forefathers, who took too parochial and narrow a view. To-day the Corporation was trying to look ahead and take a broader and wider view, considering not merely the present, but the future.

Submitting "The Guests," Mr. N. Hopewell remarked that the building industry ranked second in the town. Though their trade was the target for many jests, they had not been accused of being a town of jerry-builders.

Mr. W. J. Board, who replied, said the city had never progressed as much, was never spending so much money, and never had bigger schemes in hand than to-day.

Mr. G. A. Hewitt, president of the Midland Federation of Building Trades Employers, and Mr. E. H. Heazell, president of the Nottingham and Derby Architectural Society, also responded.

NEW BUILDINGS

Sittingbourne.—Erection of 176 houses, first instalment of a total scheme of 750 houses, at Kemsley Garden Village, for Messrs. Edward Lloyd, Ltd., paper manufacturers. Architects, Messrs. Thomas Adams & Longstreth Thompson, FF.S.I., MM.T.P.I., 121, Victoria-street, Westminster, S.W.1. Builders, Messrs. E. Bishop & Sons, Albany-street, Sittingbourne.

Oxford.—Messrs. F. W. Woolworth & Co., Ltd., of Victory House, Kingsway, London, expect to commence operations in January for the conversion of the "Roebuck" Hotel, an old coaching hostelry, which was acquired by them some time ago, into a branch stores. The interior will be entirely gutted and rebuilt, and show-rooms and a restaurant erected. The interior fittings and equipment will all be carried out in hardwoods, and the shop fronts will be of brass and art metal work. The work will be executed by the company's own building staff, under the direction of their staff architect, Mr. W. Priddle.

New Y.W.C.A. Club.

A scheme to erect, at a cost of £200,000, a Y.W.C.A. club building in the centre of London for the use of 800,000 girls has been proposed.

THE RENT ACT

Transfer of "Burden or Liability."

unusual point was raised under the Rent
in the recent case, Hornsby *v.* Maynard
Weekly Notes, November 29). The plaintiff
the owner of a house at Ealing which,
August 3, 1914, was let by her at a rent
16s. per annum, she paying rates, this
becoming the standard rent. In 1917, the
iff had let this house to the defendant
term of three years, at a rent of £36 a year,
was a term of this agreement that the
dant should pay the rates and also give
plaintiff the use of the drawing room
bedroom on the same floor for her own
ation. On the termination of this agree-
in August, 1920, the defendant had
ned on as a statutory tenant. On Septem-
, 1920, the plaintiff had served on the
dant a notice to increase the rent to £46 16s.
the defendant had paid the increased rent
to the end of 1922, but he then ceased to
rent on the ground that the notice was
id and that he had paid rent in excess of
for which he was liable. In November,
, the plaintiff commenced the present
n in the county court for recovery of
ession of the house and £33 rent, being the
for eleven months at £36 per annum.
defendant denied that the sum claimed was
g and counterclaimed for excess rent paid
m, and at the trial it was contended on his
f that the transfer to him of the payment
es and the license he had to give to the
iff to use two of the rooms in the house,
burdens or liabilities previously borne by
andlord transferred to him within section 2,
ection (3) of the Act of 1920, and amounted
ber to an alteration in rent which exceeded
standard rent by more than the amount
itted, and that as the clause in the agree-
was an exception from the demise and only
of the house was thus let to the defendant,
ent should be apportioned, and that on
grounds the defendant was entitled to
urn of rent overpaid.
e county court judge assessed the transfer
e rates at £10 16s., so that if this was treated
nt, it only brought the rent up to, but not
nd, the standard rent, and he held the
se to use the two rooms could not be
ed as either rent or an exception from the
se, but, in case of an appeal, he fixed the
of this license at £10 16s. He found for
plaintiff for £33, the rent claimed, but for
lefendant on the counterclaim for £24 6s.
overpaid under the invalid notice of
ase, thus giving judgment for the plaintiff
the balance.
e defendant appealed on the ground of the
se, which he alleged should be treated
r as rent, or an exception from the demise,
a Divisional Court dismissed the appeal,
ding that the provision in the agreement was
an exception from the demise, and the agree-
t was a demise of the whole house; the
iff had only a personal right to use the
rooms in question for her own convenience,
the defendant was not entitled to an appor-
nent as though only a part of the house
let to him. The provision as to the two
as was not a transfer of a burden or liability
iously borne by the plaintiff within section 2,
ection (3), nor could it be said that the rent
thereby been increased within the meaning
ction 1; in that section and throughout the
the term "rent" meant rent payable
oney and money alone, and this was borne
by decided cases.
the present brief report, the cases are not
n, but no doubt they are Westminster and
ral Properties and Investment Co. (*The
der*, August 15, 1919), Isaacs *v.* Tittlebaum
Builder, March 26, 1920), and Mackworth *v.*
ard (*The Builder*, April 15, 1921), all of
h cases turned upon the question whether
or rates and taxes should be computed in
ence to standard rent, Glossop *v.* Ashley
Builder, April 15, 1921), where a "tie"
public house was excluded, and Brakspear
arton (1924, 2 K.B. 88), where a discount on tied prices had been withdrawn on the granting of a new lease of an inn, and this was held not to constitute a burden or liability imposed upon the tenant under section 2, subsection (3).

We have dealt with the only point reported in this case which was before the Divisional Court and the subject of appeal, but, as it may be noticed that in the court below judgment had been given on the counterclaim for rent paid in excess down to the end of 1922, it may be useful to our readers if we remind them of one or two points in connection with increases of rent and the time limits imposed. If the notice of increase is unaccompanied with or does not contain a notice to quit, that is no longer a defect, as by section 1 of the Rent Restrictions (Notices of Increase) Act, 1923, a notice to increase rent operates as a notice to quit, and that section is retrospective in its effect (Landrigan *v.* Simons, 1924, 1 K.B. 509, *The Builder*, October 3, 1924; Aston *v.* Smith, 1924, 2 K.B. 143, *The Builder*, August 22, 1924), but by the proviso to that section neither party can recover from the other sums paid before December 1, 1922 (see Landrigan *v.* Simons). If a notice to increase rent is deficient and the error or omission is due to a *bona fide* mistake on the part of the landlord, the county court, under section 6 of the Rent Act, 1923, has power to amend it, but by section 8 of that Act a time limit is introduced as regards notices so amended. By subsection (1), no increase of rent payable in respect of an amended order is recoverable in respect of any rental period which ended more than six months before the date of the order to amend, and by subsection (2) any sums paid by a tenant which is made recoverable by a tenant by section 14 of the principal Act, are only recoverable within six months of the date of payment, or, in the case of a payment made before the passing of the Act of 1923, at any time within six months of the passing of the Act (June 7, 1923). It is to be noticed that this section is, by subsection (3), not to affect the operation of the Notices Act. This section was considered in Williams *v.* Britannic Merthyr Steam Coal Co., Ltd. (1924, 2 K.B. 334, *The Builder*, October 31), but as we explained in our note to that case, we found the decision difficult to follow as the court held that the time limit in subsection (1) applied to the landlord (who had deducted increased rent from the wages of an employee under amended notices of increase), rendering sums so deducted more than six months before the order of amendment "irrecoverable" by the landlord, and therefore "recoverable" by the tenant under section 14 of the principal Act, but that subsection (2) of section 8 of the Act of 1923 had no application to the circumstances of this case.

In the case under consideration it may be assumed the notice of increase had been defective, not merely for want of notice to quit, but in other respects, and that no amendment had been made. The path of the landlord under the Rent Acts is, indeed, a thorny one, and in connection with claims made for the return of rent paid for many years without demur, some time limit appears very necessary. In Brakspears' case, the judge who tried the case commented on the aid the Rent Acts gave to persons who desire to act discreditably.

The Rent Acts Standard Rent.

WE may note another recent decision under the Rent Acts as to apportionment of rent where part of the premises are let off, and the calculation of the standard rent, in the case Westcott *v.* Bowes (*The Times*, December 3). The defendant was the landlord of a house which on August 3, 1914, was leased at a rent of £85 a year, the tenant then paying the rates. At some date after August 3, 1914, the house was let by the landlord in separate floors, the landlord then paying the rates, and in October, 1918, under these conditions the plaintiff had become tenant of the first floor. In 1923 the plaintiff applied in these proceedings for an apportionment of rent, and he also claimed to be entitled to recover rent overpaid.

The County Court judge had apportioned the standard rent of the first floor at £2 10s., and this figure was not contested on the Appeal, but in order to ascertain what, if any, rent had been overpaid, he had to determine what was the "net rent," as the increases allowed in section 2 subsection (1) pars. (*c*) and (*d*) are calculated on the net rent, and he had held that the landlord's proportion, of the rates was 18s. 6d., and deducting this from the £2 10s., the net rent would be £1 12s.

By section 12 subsection (1) par. (*c*) the expression "net rent" is defined as meaning, "Where the landlord at the time by reference to which the standard rent is calculated paid the rates chargeable on, or which but for the provisions of any Act would be chargeable on the occupier, the standard rent less the amount of such rates in any other case the standard rent." The Divisional Court held that at the time referred to in this paragraph as the rates were paid by the then tenant and not by the landlord the standard rent and the net rent were not different, but one and the same thing, and the assessment of the County Court judge was wrong, the standard rent and the net rent being £2 10s.

COMPULSORY ACQUISITION OF LAND

A SPECIAL lecture on the subject of the "Compulsory Acquisition of Land" was given recently at the College of Estate Management, by Mr. E. W. Eason, F.S.I., F.A.I.

The lecturer opened his subject with a brief outline of the various examples of compulsory acquisition, such as that which took place in England under William the Conqueror, down to the commencement of the nineteenth century. At this time the rise of the railways and industrial undertakings necessitated some compendious forms of Acts which would prevent the Statute Book from becoming too bulky. The result of the Committee of Mr. Gladstone, in 1844, was the passing through Parliament of three general Acts known as the "Companies Clauses Act," "Land Clauses Act," and the "Railway Clauses Act."

Modern views with respect to compensation caused a revulsion of feeling from the legislation favourable to the landowner, and after the War it was felt that the Land Clauses Act was out of date, and that some more modern method of dealing with compulsory acquisition of land should be provided. The important Committee, presided over by Sir Leslie Scott, in 1917, resulted in the Acquisition of Land Act of 1919, which provided the general principles of compensation where Government Departments or local or public authorities desired to acquire land.

The lecturer then considered another class of Acts of Parliament dealing with the improvement of the housing of the people as a whole, and after considering the terms of the Housing of the Working Classes Act of 1890, proceeded to deal with an entirely new form of compensation embodied in certain sections of the Housing and Town Planning Act of 1919, whereby in place of the various interests in property being valued a certain portion of the property was valued under certain principles, and this sum of money was then allocated to the various interests.

Obituary.

The death occurred recently of Mr. Thomas Cartwright Pegg, builder and joiner, of Derby-road, Ashbourne, at the age of 81.

The death has occurred at Spring Bank, Kirkoswald, of Mr. Anthony Watson, aged 84 years, who had for many years been associated in the management of the firm of Messrs. Watson & Son, builders and contractors.

The death has occurred of Mr. Thos. Walton, aged 77, builder and contractor, of Villa Real-road, Consett.

Builder's Estate.

Mr. Cephas Gradwell, of 85, Clarendon-road, Chorlton-upon-Medlock, Manchester, builder and contractor, £57,885.

CONTRACTS, COMPETITIONS, &c.

Forsome contracts still open, but not included in this List, see previous issues. Those with an asterisk are advertised in this number. Certain conditions beyond those given in the following information are imposed in some cases, such as that advertisers do not bind themselves to accept the lowest or any tender; that a fair wages clause shall be observed; that no allowance will be made for tenders; and that deposits are returned on receipt of a bona-fide tender unless stated to the contrary.

The date given at the commencement of each paragraph is the latest date when the tender, or the names of those willing to submit tenders, may be sent in; the name and address at the end is the person from whom or place where quantities, forms of tender, &c., may be obtained.

BUILDING AND PAINTING.

DECEMBER 22.—**Aberdeen.**—COTTAGE.—For joiner, slater and plaster works, for the erection of a workman's cottage at Rocks of Balmedie Quarry, Belhelvie, for the D.C. The District Clerk, 7, Bon-Accord-square.

DECEMBER 22.—**Brighton.**—HOUSES.—Erection of 11 houses in Hereford-street, Brighton, for the County Borough Council of Brighton. Borough Surveyor, Town Hall, Brighton. Deposit £1.

DECEMBER 22.—**Bucklow.**—BUILDING.—For a veranda at the Institution Hospital, Knutsford, for the B.G. Mr. G. Leigh, Clerk to the Guardians, Union Offices, Knutsford. Deposit 10s. 6d.

DECEMBER 22 — **Edinburgh.** — EXTENSION. — For brick, &c., carpenter, joiner and glazier, plaster and harling, plumber at Tynecastle school, for the E.C. Mr. J. Stewart, S.S.C., Executive Officer, Education Offices.

DECEMBER 22.—**Failsworth.**—CONVERSION.—For the work and all materials required in the conversion of 27 privies to water-closets, for the U.D.C. Mr. H. C. Broome, Clerk to the Council, Town Hall.

DECEMBER 22. — **France and Belgium.** — HEADSTONES.—Tenders for a total supply of 20,000 headstones, packed and delivered (f.o.r.), to be divided into a number of contracts, none of which shall be for less than 100 headstones, for the Imperial War Graves Department. The Secretary, Works Department, Imperial War Graves Commission, 82, Baker-street, London, W.1, and marked "Headstone Contract, 5079 W."

DECEMBER 22.—**Manchester.**—BOILER HOUSE.—For erection of a boiler house, timber store, &c., at the Hyde-road car depot, for the T.C. Mr. P. M. Heath, Town Clerk, Town Hall. Deposit £1 1s.

DECEMBER 22.—**Rowley Regis.**—HOUSES.—For erection of 16 houses at Hill-road, Tividale, &c., for the U.D.C. Mr. D. Wright, Clerk to the Council.

DECEMBER 22.—**Shoeburyness.**—CONVENIENCE.—For the enlargement of the existing public conveniences upon the Common at Shoeburyness, and the construction of a public convenience and refreshment room on Whitakers-parade, Rampart-street, Shoeburyness, for the U.D.C. Mr. F. Gregson, Clerk, 46, Alexandra-street, Southend-on-Sea.

Hodges: house in Station-road, Crowborough, for Messrs. Connor; house in Queen's-road, Crowborough, for Miss Holmes; house in Pilner-road, Crowborough, for Mrs. Campbell; house at Sweet Hawes, Crowborough, for Mr. Buckingham; bungalow in Harlequin-lane, Crowborough, for Mrs. Stuckey.

UXBRIDGE.—It is suggested that the Council should provide conveniences throughout the district.—Plans passed: Bungalow, Derby-road, for Mr. C. B. Payne.

WAKEFIELD.—Plans passed: Two houses in Thornes-road, for Messrs. J. W. Easter and B. Buckland; two houses in Cross-lane, for Messrs. Kilkenny Bros.; house in Thornes-lane, for Mr. H. Campbell; house, in Agbrigg-road, for Mrs. Raby.—The Corporation are to erect four houses at an estimated cost of £1,800.

WARWICK.—The T.C. is to erect another 32 houses.—Plans passed: House, Bridge End, for Mr. A. Tilt.

WELLFIELD.—Durham County E.C. has purchased a site for a new secondary school.

WELLINGBOROUGH.—The U.D.C.'s committee recommended the Council to apply for sanction to grant subsidies in respect of 40 further houses.—Plans were passed for five houses in The Drive, one in Broadway, and Gisburne-road, and six in Hatton Park-road.

WELWYN.—The R.D.C. has decided to apply to the Public Works Loan Board for a third advance of £15,000, under the mortgage for £40,700 in connection with Welwyn Garden City housing scheme No. 3, and sanction to an additional loan of £280 for cottages at London-road. Plans approved: House, Mardley Hill estate, for Mr. H. F. Crawhall.

WEST HARTLEPOOL.—Plans passed by the T.C.: Detached house, Park-road, for D. Edgar; bungalow, Stockton-road, Mrs. Marwood.—The M.H. has approved the Corporation giving subsidy to the erection of 32 houses.

WEST LANCASHIRE.—Plans approved by the R.D.C.: Bungalow, Moss-lane, Hesketh Bank; house, Aughton; bungalows, Maghull; bungalow, Aughton; pair of houses, Tarleton; pair of bungalows, Halsall; detached house, Halsall.

WEYBRIDGE.—The general committee of the Cottage Hospital have decided to go ahead with their proposed building operations. The cost is estimated at £25,000. Plans have been prepared by Messrs. A. W. Kenyon and S. G. Livock, of London.

WEYMOUTH.—The T.C. passed plans: S. Jackson & Sons, for Mr. K. Openshaw, pair of semi-detached houses, Southlands-road; A. Knell & Sons, pair of semi-detached houses, King's-road; J. F. Annan, house, Icen-road; A. Knell & Son, for T. Pritchard, Radipole, pair of semi-detached bungalows, Coronation-road; Mr. Masters, for Mr. R. James, bungalow at the corner of Icen-road and Dorchester-road.

WHITLEY.—The U.D.C. passed plans: Mr. W. Poole, two pairs of semi-detached houses on the Ruswarp Hall estate; Mr. W. G. Smithson, house, in Ruswarp-lane.

WHITWOOD.—A site has been acquired at the Four Lane Ends, Whitwood, 16 acres in extent, upon which it is proposed to erect the Mining and Technical Institute to serve the Castleford and Normanton district. Tenders are shortly to be invited.

WIGAN.—The T.C. is to erect a new pavilion in Mesnes Park.

WIGTON.—A water scheme to cost £20,500 has been decided on by the R.D.C.

WIMBLEDON.—The B.C. passed plans: H. Coombs & Son, two houses, Devas-road; R. J. Thomson, house, Belvedere-drive; Hill & Gurr, house, Merton Hall-road; R. J. Thomson, house, St. Mary's-road; F. M. Thompson & Sons, Ltd., house, The Drive; R. Sharp, house, Dora-road; Bleach & Dorey, Ltd., two houses, Queen's-road; H. Guest, two bungalows, Queensmere-road; W. H. Whitehead & Co., house, Conway-road; H. & G. Longhurst, house, Montana-road; E. W. Fisher, house, The Common.

WINDLESHAM.—The U.D.C. decided to build 30 houses.

WINSFORD.—Cheshire County Surveyor has prepared plans for the reconstruction of the county bridge, at a cost of £3,600.

WITHNELL.—Plans have been approved for the erection of a new warehouse at Fenniscowles, for the Star Paper Mill.

WOKING.—The U.D.C. approved plans of 11 houses, and a new church and hospital in connection with St. Peter's Harbour, at the junction of Lavender-road and Maybury Hill.

WOLVERHAMPTON.—The T.C. approved plans: J. Love, house, Bamford-road; G. Oliver, two houses, Lea-road; J. Patten, two houses, Richmond-road; A. M. Griffiths, eight houses, Newhampton-road and Park-road East; S. J. Matthews, house and shop, Cannock-road; G. H. Jevon, bungalow, Penn-road; Caddick, Son, & Yates, Ltd., two houses, Fowler-street; G. H. Guest, house, Park-avenue; G. Shale, house, Park-avenue; J. Patten, two houses, Richmond-road.

WOMBWELL.—The U.D.C. has adopted an improvement scheme for the Hemingfield-road; estimated cost of full scheme is £8,000.—The U.D.C. approved plans: A. Mattocks, two houses, King's-road; J. Mattocks, two houses, Kelvin-grove.—The U.D.C. propose to erect 60 additional houses.

WORCESTER.—The City Council propose to carry out a scheme for the erection of 122 houses at Goodrest, in addition to the 68 now in course of erection at Bromyard-road site.

WREXHAM.—The Electricity Committee of the T.C. propose to erect a sub-station at the Garden Village, at an estimated cost of £1,225.

WYKE.—The Bradford Corporation tramways committee propose to erect a new tramway shelter at the south-west corner of the Wyke Council School site.

YORK.—J. Terry & Sons, Ltd., of Clementhorpe, are to erect a new factory on a town-planned area. Plans have been prepared by the firm's architect's department.

FIRE.

LONDON.—A fire broke out recently in a block of warehouses and offices, known as Bentley House, Beat-street, near Regent-street. The damage is estimated at over £15,000.

Building Trades Employers.

Over 75 members attended the annual dinner at the Pit and Nelson Hotel, Ashton-under-Lyne, of the Ashton, Stalybridge, Hyde and District Allied Building Trades Employers' Association. The company included master builders, plumbers, painters, &c., and Mr. E. Warrington, President, occupied the chair.

Mr. Warrington expressed pleasure at such a large gathering of allied building trades employers. Such a function was a good augury of a joint association, which was necessary if the objects for which the representative association had been formed were to be attained.

Mr. Charles Marshall (Ashton), in proposing "The Allied Building Trades Employers," said if the employers were to retain their present position as employers they must be united.

THE SCOTTISH BUILDER

FAMOUS SCOTTISH ARCHITECTS

In the last issue of the *Quarterly Illustrated* of The Incorporation of Architects in Scotland an account, by Mr. T. Harold Hughes, A.R.I.B.A., is given of the life of the famous Scottish architect, James Craig. Craig was born in the year 1740, and received his architectural education in London as a pupil of Sir Robert Taylor, an architect whose best-known work, perhaps, is Ely House, Dover-street.

Proposals for the extension of Edinburgh had been propounded by the end of the seventeenth century, for which James VII is credited. As Duke of York, it is stated that, on a visit to the city he pointed out to the magistrates the possibilities of city extensions to the north and south. John, the eleventh Earl of Mar, is another who is believed to have had schemes of which the New Town was the final outcome. It was not, however, until the year 1752 that the magistrates first seriously considered the project of extending the city. By this year (1752) powers had been obtained to "Enlarge and Beautify the City," but the Royalty did not extend to the area to the north. Other improvements were undertaken of which the most important was that of building the North Bridge. In 1763 the North Loch was drained and the first stone of this bridge (of which William Mylne was the architect) was laid on October 21. Following this the magistrates again attempted to extend their Royalty, and this time sanction was given to build to the north. A competition was inaugurated for plans for the new town, "Conform to which buildings might be erected in the most regular, handsome and commodious manner." Craig's opportunity came when he was but 27 years of age, and his design was adopted.

The site was a virgin one. Along the crest of the hill Craig ran his main street, George-street, terminating it at each end with a large square. At the west end was Charlotte-square, with a central plot of grass and obelisk, the centre of the west side—on the axis of the street—being marked as a site for a church. St. Andrew-square, at the east end, is similar, the church site on the eastern side balancing that to the west of Charlotte-square. A small point of difference is the placing of two statues in St. Andrew-square, both facing towards George-street. This fine street, with its two well-proportioned squares, formed the main axis of Craig's stately plan. Parallel to it, and on the southern slope, was Princes-street, the southern boundary of which was formed by gardens and a broad canal on the site of the old North Loch. Balancing Princes-street on the northern slope the line only of Queen-street is indicated, the further northern development of the "New Town" being subsequent to Craig's plan. The cross streets, St. David's, Hanover, Frederick, Castle and Charlotte-streets divided the area up into large blocks which were further divided up by minor streets and lanes. The whole plan was simple and dignified. There was nothing faltering or amateurish, and its simplicity and directness is all the more remarkable when we consider that Craig was hardly 27 years old when he prepared his scheme.

In addition to planning the New Town Craig was responsible for several buildings, of which the most important was the old Physicians' Hall, built on a site in George-street, opposite to St. Andrew's Church. The foundation stone was laid on November 27, 1775. The building covered an area of 83 ft. east to west, by 63 ft. deep, and was three stories in height.

In 1776 the foundation stone was laid for an Observatory on the Calton Hill, for which Craig was the architect. The building, altered and added to, still exists. It is circular in form, of about 25 ft. diameter, with a rectangular wing. It was probably intended that it should be harled with stone facings to the windows. Robert Adam appears to have been consulted in the matter, and he suggested that, owing to the nature of the site, the edifice should be constructed to have the appearance of a fortification! The three buttresses which now exist seem to have been added subsequent to the general building, probably as a result of Adam's suggestion, and whilst the lower windows are square the upper ones have pointed arches. All the money available was expended before the design was completed, and it had to be finished—not until 1792—in "an inferior style."

Whilst the Observatory was being built Craig erected a block of buildings on the west side of the south end of the North Bridge.

Craig died on June 23, 1795, a comparatively young man. He had lived to see his fine scheme for the New Town realised, but he also lived to see less enlightened City Fathers than those who chose his plan allow the normal eastern development of his design to suffer neglect. The New Town of Edinburgh, however, will always be one of the fine things that this country has produced, and Craig's niche in the Temple of Fame is assured.

NEW BUILDINGS IN SCOTLAND

Grangemouth.—HOUSES.—The T.C. has decided to proceed with a further housing scheme in the new town, to consist of 54–64 houses. The Burgh Engineer has received instructions to prepare plans.

Arbroath. — EXTENSIONS. — The Forfarshire E.C. has submitted plans to the Dean of Guild Court in connection with the extensions to the High School to be used as a mechanical engineering room. The estimate is £900.

Greenock.—BUNGALOW.—The Dean of Guild Court has passed plans for the erection of a bungalow at Carmichael-street, for R. Aitkenhead & Sons.

Loanhead.—HOUSES.—The T.C. reported that a scheme was under negotiation for 100 houses.

Dumbarton.—TENEMENTS.—The Dean of Guild Court has passed plans for the erection of four tenements at West Bridgend.

Dalkeith.—EXTENSIONS.—Approval has been granted for the proposed extensions at Dalkeith School, for the Midlothian E.C., at an estimated cost of £16,500.

NEW CINEMAS

We understand that tenders are now being invited in connection with the erection of a new cinema in Townsend-lane, Liverpool. The plans are by Messrs. Pritchard & Lewis, AA.R.I.B.A., 11, Dale-street, Liverpool, the scheme being under the direction of a local syndicate.

We also understand that a contract has been signed with Messrs. Dryland & Preston, Ltd., Topping-street, Blackpool, for the erection of the new Rendezvous Cinema at Church-street, South Shore, Blackpool. Plans have been prepared by Mr. Richard Anderton, A.R.I.B.A., 6, Kenilworth-gardens, South Shore, Blackpool, and provide for a seating capacity of about 1,250. The main entrance is to be in glazed terra-cotta; the foyer walls will be decorated with tapestry panels with a coffered and dentilled ceiling, and flooring rubber Grecian tiling. The roof is to be of steel trusses with a vaulted fibrous ceiling suspended therefrom, and heating will be provided by a low-pressure hot-water system, and ventilation by exhaust trunks and extract fans. Seating will be by tip-up chairs throughout, and the balcony is to have upholstered bucket seats.

A new cinema and ballroom, we are informed, are to be erected on the site of the Old Miners' Hall, Durham. The architects are Messrs. S. J. Stephenson, 20, Saville-row, Newcastle-on-Tyne, and the plans have been approved. The cinema is to have all modern fittings and is to accommodate 800, while the dance hall is to accommodate 150.

The construction of the new Pavilion at Bournemouth by the local Corporation has commenced. This work is estimated to cost £180,000.

The Hayes, Middlesex, local authorities have had submitted to them plans for a new cinema at Hayes, to seat 750 people.

A new cinema in place of that recently destroyed by fire, is to be erected at Roscrea, Ireland; also a new picture theatre, to be named the Central Hall, to seat 500, at Strand-street, Clonakilty.

A concert hall and roof gardens to accommodate 1,500 persons is among the proposals of the Bath Corporation.

The West Pier Co. are about to reconstruct parts of the Brighton Pier.

We are informed that the Variety Theatre Consolidated, Ltd., 25, Charing Cross-road, W.C.2, have under consideration the improvement of the South London Palace, London, S.E.1. Plans for extensive alterations have been made by Mr. Cecil Masey, 19, Devereux-court, Strand, W.C.2, and include the reconstruction of the stage and auditorium, &c. Tenders are now invited.

That the contract in connection with the erection of a new cinema—"The Playhouse"—at Bury St. Edmunds has now been placed with Messrs. Pollard & Skerritt, 88, St. Helen's-street, Ipswich. Operations are to be commenced immediately. No sub-contracts have yet been settled.

L.C.C. Housing Schemes.

The Housing Committee recently submitted proposals for development to the London County Council. An expenditure of £81,479 is involved for the erection of 160 tenements on East-hill estate, Wandsworth. Tenders have been invited for the erection of 422 houses on the remainder of the Roehampton estate. A number of these houses, not exceeding 39, will come under the Act of 1923, and the Council were asked to approve a separate estimate for them amounting to £26,286. On the White Hart-lane estate, Tottenham, for Lordship-lane frontage, it is proposed to erect 70 three-story dwellings at an expenditure of £90,490.

Greenock Housing Scheme.

A large area has been acquired in the south-west part of the town, and plans have been prepared for the construction of 700 houses, and it is also intended to increase the number of dwellings to be built under the slum clearance grant to 1,000.

THE BUILDER

JOURNAL FOR THE ARCHITECT AND CONSTRUCTOR.

WITH WHICH IS INCORPORATED "THE BRITISH ARCHITECT."

VII.—No. 4273. DECEMBER 26, 1914.

ARBITRATION IN BUILDING DISPUTES

N the carrying out of a building contract, it is to the best interest of all concerned—the employer, the architect or surveyor, and the contractor—that the work undertaken should be allowed to progress to satisfactory completion, with the utmost expedition compatible with skilful workmanship; and that, in an atmosphere of ual confidence, consideration and help. To this end it is of mount importance that building contracts should be drawn with the utmost care and foresight, and with absolute erity of purpose—not forgetting that where works of nitude are involved, or in any case where complications to be expected, the assistance of an experienced lawyer is spensable in the framing of the clauses going to make up h contracts. These clauses should be expressed in terms ch are as lucid, concise and unambiguous as possible; such aseology being employed as is the customary language of trade; and even this carefully checked so as to be in mony with any special usage or terminology of the particular rict in which the work is to be carried out. The conditions out should be comprehensive, explicit and final in purpose, couched in terms calculated to prevent misunderstanding disappointment between, and to, all parties.

However, though the work of drawing up the contract may ndertaken conscientiously and skilfully, absolute perfection complete foresight is an ideal humanly impossible of attain- t in any but the most simple of documents. This element ncertainty is peculiarly present where a building or engi- ring contract is entered into; because, for example, Nature, he course of excavations, may disclose to the contractor o has been guided by a geological survey map and its rions, uncharted variations of strata which materially ct the cost of digging; then there are fluctuations of market es, and the possibility of strikes—these and other unforeseen elopments or contingencies must always be bogies to the tractor when the conditions are put before him; and, for reason, every building or engineering contract should, and st of them do, contain an arbitration clause, providing for iew and settlement of any dispute which may arise during gress by submission to a mutually elected referee—the itrator. The ultimate benefit of such a clause is that, ost invariably, it makes resort to litigation unnecessary—ess, of course, some actually criminal charge is made against ier party of a nature which can only be dealt with by the rts. The method of arbitration is welcomed, as a rule, by h disputants, as the proceedings are conducted in private, the procedure itself is less formal, and usually less costly.

If there is no arbitration clause in a contract, the obvious iedy of the aggrieved party would be resort to the courts; very often, even at a later juncture when a dispute has ually arisen, submission to arbitration suggests itself to h parties as a preferable means of settling their differences; l then an arbitrator, mutually elected, must be invited to udicate between them. Indeed, the present time has been ed "the age of arbitration." And on every hand, in com- rcial and other circles, this method is gaining growing ularity over that of discussion in open court. Arbitration tself probably the more ancient method. Plato, in "The ws," written about 350 B.C., says: "In the first place, re shall be elected judges in the courts who shall be chosen the plaintiff and defendant in common. These shall be led 'arbiters' rather than 'judges.'" In Blake's case 06) 6 Rep. 43*b*, it was stated "generally in all actions where nages only are to be recovered arbitrament is a good plan." cial courts of arbitration have been of late years set up to l with disputes in individual trades or occupations, expert ness being given by members of the particular trades con- ned, and decisions being, generally, more acceptable than se given in the ordinary courts.

Decision and award by an arbitrator is particularly satis- tory and conclusive when the dispute involves, or turns on, tters of technical phraseology or detail, which can essentially ly be thoroughly understood and impartially reviewed by persons who have acquired, by practical experience, a personal knowledge of the customs and terminology of the trade or community within the sphere of which the dispute has arisen. Such persons are more likely to be guided by solid facts, and their decisions untrammelled by sentimental considerations which might affect the verdict of a jury. In fact, to a person called upon to act for the first time in his experience, the whole duty of an arbitrator may appear to be discharged by the exercise of technical knowledge, common sense and impartial judgment, with an absolutely unbiassed mind. But if his qualifications as an arbitrator end there, he will find himself confronted, at the incidence of the first complication, with the demands of rules of law relating to evidence and equity, contract law, and stamp laws; and he will have, in such circumstances, the greatest difficulty to sustain his dignity and prestige, or indeed to give an award acceptable to both parties. Lacking sufficient knowledge of these laws, and sufficient acquaintance of the established rules governing their application, he is likely to make the mistake of following crude and arbitrary principles of his own, and thereby to come into conflict with experienced expert witnesses, not so ill equipped as himself, if such witnesses be present.

It is common knowledge that, in the past, many arbitrations in building disputes have been conducted with no greater seriousness than that of "hearing both sides and halving the difference"; but, as in all other activities, the greater keenness of modern times demands an increasing degree of exactness in the sifting of evidence and in the nature or magnitude of the award. It is not unusual that the validity of an award is disputable, not because its ultimate justice is questionable, but because the procedure at the inquiry can be criticised as having been irregular.

It has been stated above, and probably will be vigorously disputed by some, that an arbitration, as a means of settlement, is less costly than an ordinary action in the courts. It must be admitted that there are on record cases where the costs of arbitration have totalled an amount out of all proportion to the matters submitted for decision, or to the benefit received by the successful disputant; and, in all probability, beyond those which would have been incurred in the ordinary courts. But it is seriously contended that, where this has happened, it is traceable invariably to the lack of knowledge on the part of the arbitrator of the essentials of legal procedure and the rules of evidence, and his consequent "amateurishness" resulting in much confusion and waste of time at the inquiry; especially in permitting lengthy and detailed discussion on technicalities on which his opinion may be final and valuable, but which have no direct legal bearing on the decision and award, or should not have if these be impartially given. Without question, therefore, arbitration, in skilful hands, is by far the less costly venture.

It should always be borne in mind that an arbitration is a *trial*, and should be conducted as such. Its institution is not to permit laxity, but to give greater freedom to expert and particular evidence *without* interfering with the course of legal justice and precedent. Frequently, when cases demanding such special treatment are taken into court, the court or judge will decide that they shall be sent to arbitration. This is a possibility which should always be kept in view by litigants. Technical cases are frequently ordered to be heard by an official referee.

The subject of arbitration being then one of general and vital importance, we have concluded that our readers will find of practical use and interest a series of articles which we propose to introduce in our New Year's issue. The subject will therein be treated in a popular but practical manner, mainly for the benefit of those, outside the legal profession, who are interested in building enterprises, great and small. Common types of dispute will be discussed, and the operation of the Law of Arbitration explained; sufficient reference to leading cases being given for the assistance of those tempted, by interest or necessity, to a more minute study of the subject.

NOTES.

The late Mr. Waterhouse.

THE tragic death of Mr. Paul Waterhouse will have been heard with deep regret by the whole profession and many others in the associated arts and crafts, while to his personal friends—and he had more than most men—his sudden and unexpected death will be an irreparable loss. As the son of Alfred Waterhouse, R.A., his outstanding qualities were well known before his presidency of the R.I.B.A., but during the somewhat turbulent period of his years of office, his tactful leadership, his logical and witty speeches, and above all his impartiality, shrewdness, and the subtle charm of his personality, gave him a position in professional regard which few presidents have attained in the past. As an after-dinner speaker he had a reputation which extended far beyond the ranks of the profession, and those who heard him could not fail to be charmed by his easy and graceful delivery and the wit and brilliance which his speeches invariably displayed. No profession can afford to lose men of culture, and to the architectural profession the death of Paul Waterhouse, at the somewhat early age of 63, is a distinct loss.

Bricklayer Apprentices.

A PROPOSAL which we believe is on foot to train five hundred young apprentices to the bricklaying trade is likely to include important consequences on the future of the industry. The subject has become loaded with a good many debatable, if not obsolete, considerations. The craft of bricklaying we do not suppose to be one more difficult to acquire than that of the potter or other similar undertaking entered on after a training not made to cover so many preliminary years. Practise in bricklaying will give no doubt a speed and finish not otherwise to be acquired, but we ought not to be afraid, at a time when there is such need of bricklayers, to get apprentices through the necessary training required as quickly as possible, and on to the job. There has been a tendency to exaggerate the mystery of industrial training of this kind, and the amount of time required to equip the apprentice for his work. The war, however, revealed to us how under the compulsion of circumstances men did successful work with less than the ordinary training, and sometimes with none at all. We have observed in country districts, where there is greater freedom of approach, building work done by the handy man not less practical and durable beca conforming to the theoretic stan approach which resists initiative is there not also a good deal o jealousy in these objections, a de mainly to sustain efficiency, but the number employed in the tra we are to get our building done w extricate ourselves from the old wont, and venture a little more, shall be not a little surprised i apprentices now to be trained do r a very good account of themselve in a very few months, they are pu actual bricklaying. At a time of we need to show ourselves a little able as to the food we eat—so work there is required the freshe new experience such as initiative, ment and new approach.

Past and Present.

A TIME that is deve seeking its pleasure preservation of the jealous of the destruction of any b with marks of by-gone character s upon it, is not a productive one, may too resolutely set our eyes o looking backwards. Youth, w sense of expansion and power, forward; old age turns back up past. May it not also be so with n

R.A. Schools' Students' Work.

Memorial Tomb in an Arched Recess. Design by MR. F. P. CHAMBERS, B.A.

[Awarded Edward Stott Prize (£50) and Silver Medal for a Model of a Design Subject combined with Architecture.]

L ... SCREEN, MIDDLETON CHURCH, LANCS.

eriod of great productive activity is ore-occupied to pore too curiously over shattered fragments of antiquity. the other hand, the preservation of historic past makes a proper and iring claim upon us. The difficulty ld seem to be to find the mean veen the two extremes—the over- fulness to preserve, and recklessness eplacement. Perhaps this is not in f easy to find. But if we felt surer ur own work and purpose, our sense proportion might be better served; were it more certain that when the had to be replaced by the new the k would be approached in a spirit ecure that it would be as good—or n better—we should be less full of siness and doubt, and the S.P.A.B. e at rest. Distrust of our own time its needs entails doubts of its direction nce we may make almost a fetish reserving what in the inexorable order hings should die.

District Surveyors' Fees.

BUILDERS generally seem unaware of the present values of District Surveyors' fees. It should be embered that the Act of 1921 increased fees by 25 per cent. and empowered London County Council to increase n by a further equal amount. The C. exercised that power to the full, making a total increase of 50 per . Recently, however, in October, reduced the fees by 12½ per cent., hat the original amounts now stand eased by 37½ per cent. It would sim- calculations for everyone concerned he present fees were increased or ced by 2½ per cent.

Report Concrete.

THE forthcoming Report of Sir Ernest Moir's Committee on new methods of house construction, promised last day by Sir Kingsley Wood, is being ited in building quarters with considerable interest. At least three drafts are already in existence and deal with various methods of utilising concrete in building working-class houses. Real progress forward has been made, since Dr. Addison agreed in 1919 that demonstration concrete houses should be erected at Acton, in our knowledge of the properties of concrete, and in various devices for making use of it economically. But we hear that almost as much difficulty is being found in deciding on the exact words of this Government Report on concrete as occurred in the drafting of the report on steel houses after the visit paid by members of the Committee on October 4 last to the Cathcart Foundry in Glasgow. Many of the same objections felt by the operatives to standardisation and the mass production of steel houses apply equally to concrete. On the other hand, the technical engineers and scientists who have been studying closely the concrete houses that have been erected during the past five years, consider that the development in this direction is full of hope for the future.

CHAIR AND PANELLING IN CHANCEL OF HOPE CHURCH, DERBYSHIRE.

"Tess" and the Dorchester Players.

THE extent to which the dramatic world is indebted to the pioneer efforts of certain producers, frequently provincial, can hardly be exaggerated. It was therefore a notable mark of appreciation when Mr. Thomas Hardy entrusted the dramatisation of "Tess" to the Dorchester Players. The building world still claims Mr. Hardy as a member of the architectural calling, and, in congratulating him on his masterpiece likes to feel that it is also congratulating itself on a member's work, in another corner of the same art field.

The A.A. Play.

THE Architectural Association have provided many delightful and clever entertainments in the past, and as their effort last year was as good as anything they had ever accomplished, it was, perhaps, too much to hope they would be equally successful this year. That the members of the Lyric Club who took part in it worked hard to do so was evident to those who saw the production last week of "Guffaws," a revue in eleven scenes, at the Royal Institute of British Architects, which provided many opportunities for good jokes and professional hits, though there were too many scenes, and one or two of them we might have been spared with advantage. Scene III was one of the best, in which "the Mistress Art" presented to her offspring Commodity, Firmness and Delight her new baby, in the form of a cake of concrete—"a colleague for a little, but a successor for good." The scenery and costumes and the acting in this scene—as indeed in most—were excellent, and showed what architectural students can do in the cultivation of the dramatic arts when they give time to their study. Those who took part in the production worked hard, especially Miss Enid Caldicott, Mr. F. Halliburton Smith and Mr. J. B. Jeffcott.

PANEL IN SCREEN, MOBBERLEY CHURCH, CHESHIRE.

[PULPIT, WARMINGTON CHURCH, NORTHANTS.

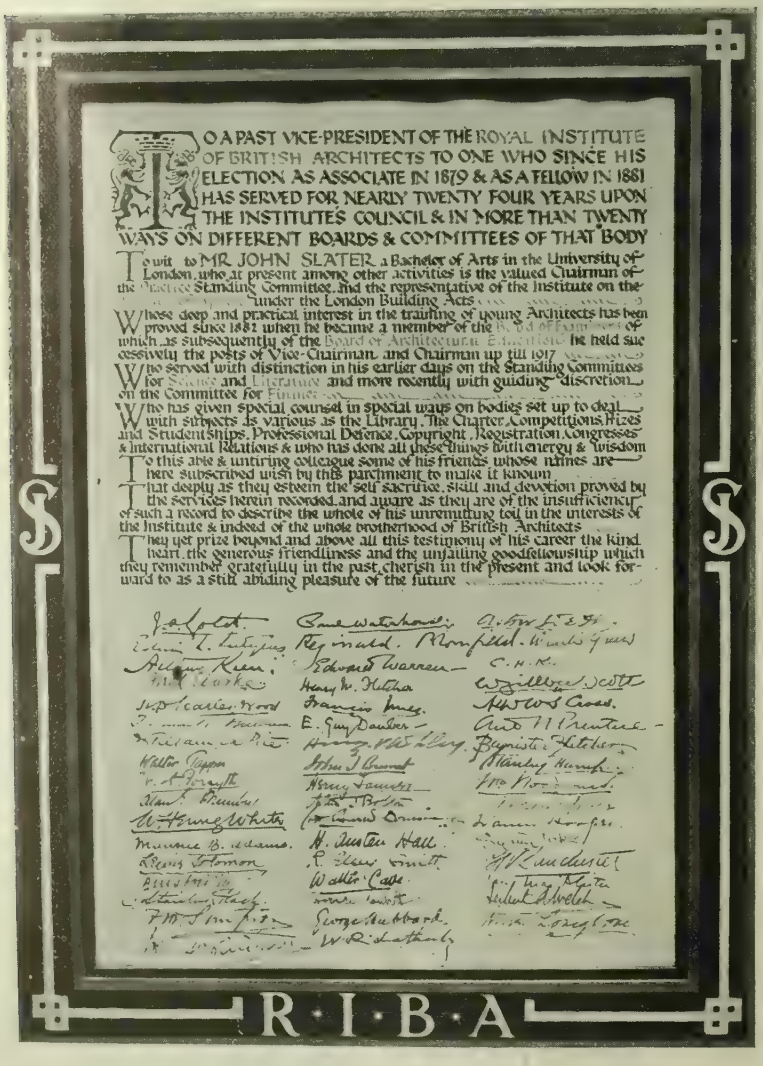
GENERAL NEWS

Professional Announcement.

Messrs. E. J. Burr, Son & Nunn, chartered surveyors, have removed to 18, Grosvenor-gardens, Westminster, S.W.1. Telephone: Victoria 9237.

New Masonic Hall.

The Right Hon. Lord Ravensworth, Provincial Grand Master of the Province of Durham, recently opened the new Masonic Hall and Temple at Castle Eden. Of modern design, the building, which is 79 ft. by 53 ft., is carried out in sand-faced bricks. The front elevation has panels in white concrete, and stone dressing, and is adorned with the masonic device. The Temple is 50 ft. by 25 ft. The walls are panelled and the seating is in oak and upholstered. Mr. J. W. English, M.S.A., of Wingate, was the architect, and Mr. W. E. M. Twedde, of West Hartlepool, the contractor.



The Weir Houses.

Mr. R. Coppock, secretary of the National Federation of Building Trade Operatives, in a recent interview in the Press, with regard to the Glasgow Corporation's decision on the Weir steel houses, said: "The attitude of the building trade operatives of this country is that wherever any firm are erecting houses which require building trade operations, building trade practices as to hours, wages, and general conditions should obtain." "This is a national decision," he commented, "and one that will be carried out on all alternative methods of house construction."

The action of the Glasgow Corporation, Mr. Coppock said, was in accordance with the Standing Orders of the Council, *i.e.*, the Fair Contract Clause. The Weir house was not an innovation in the industry, and he considered it to be untrue to allege that it was a steel one. In fact, it was a timber house with a steel outer covering, and such houses had been built in this country for years, although instead of steel corrugated iron had hitherto been employed. There was no new technique in the application of labour for the Weir house, and standardisation did not necessarily mean that craftsmanship was eliminated. There was no effort on the part of the building trade operatives to prevent the erection of any alternative type of house, but they demanded that the conditions agreed in the industry between employers and operatives should be given effect to on all alternative methods of building, following building trade practices. Mr. Coppock further declared that in October last Messrs. Weir were informed of the actual position which would result "if they attempted to pursue a practice of employing labour contrary to the conditions existing in the building industry."

Puvis de Chavannes.

In celebration of the centenary of Puvis de Chavannes a bust of the painter was recently erected in the little square separating the Sorbonne from the Cluny Museum. The monument is the work of M. Jules Dubois and below the bust a sculptured symbolical figure representing Painting is shown before the Master. Rodin's bust of Puvis de Chavannes was also placed in the Pantheon in front of the artist's famous wall painting of "The Life of Ste. Genevieve, Patron Saint of Paris."

Presentation to the late John Slater, F.R.I.B.A.

COMPETITION NE

Parish Hall, Staffs.

The assessor, Mr. W. H. Bidlake, F.R.I.B.A., has placed first the desi Messrs. Webb & Gray, MM.S.A., Dudley, competition.

Geneva Conference Hall.

The League of Nations will shortly competition for the selection of a plan construction of a Conference Hall at on the ground presented to the League City and Canton of Geneva. The comp will be open to all architects who are Na or State members of the League. An national jury, consisting of architects Great Britain, France, Italy, Belgium, A and Switzerland, will examine the plan mitted and decide their order of mer sum of £4,000 will be placed at the d of the jury for division among the arc submitting the best plans.

Industrial Designs.

In order to encourage the study of desi industrial purposes, the Royal Society decided to hold annual competitions. second competition will take place in Jun It will be open to two classes—(*a*) All subjects (with certain specified limitatio age in the sections of architectural dec and furniture), and (*b*) students in Schools of Art. Entries can only be r from individual designers, not from firms subjects of competition will be the same f classes of candidates, but in considering th the Judges will bear in mind to which cl competitors belong.

The competition will be divided und following heads:—(1) Architectural Dec (2) Textiles, (3) Furniture, (4) Book Prod (5) Pottery and Glass, (6) Miscellaneous particulars can be obtained from the Society for the Encouragement of Arts, factures and Commerce, John-street, A London, W.C.2, or can be seen at this o

The Constantine Technical College

Architects are invited to submit in this competition. Mr. Percy T F.R.I.B.A., has been appointed assess conditions can be obtained from the Se on the payment of £1 1s., not later than ber 27. Sending-in day, May 15, 1925 our issue for December 19, 1924.)

Leeds Library.

Designs are invited from architects i Riding only for a library to be erected Compton-road estate. Mr. Percy S. We ton, F.R.I.B.A., is the assessor; premiu £20, and £15. Conditions, on the payr £1 1s., from the Town Clerk, Leeds. Sen day, February 16, 1925. (See our is December, 19, 1924.)

New Offices, Nairobi.

Designs are invited for new railway to be erected in Nairobi, Kenya Colony miums of £200 and £100 are offered respe Conditions can be obtained, not late February, on the payment of one guine the Crown Agents for the Colonies, M The assessor is Mr. William Dunn, F.R Sending-in day at the offices of the Nairobi, February 28, 1925. Other competitions still open include lowing (the dates given are, first the sen date, and second the issue of *The Bu* which full particulars were given):— Hall (May 1). Manchester Art Gallery 28; Aug. 22). Jugo-Slav Landscape (D Nov. 7). Argentine Institute for the (Dec. 31, 1925; Nov. 28). Valletta (June 30, 1925; Dec. 5).

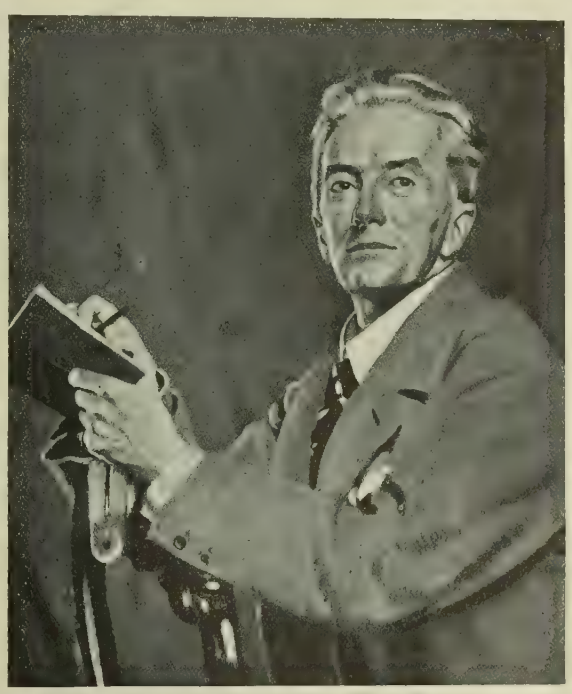
THE LATE PAUL WATERHOUSE

BY PROFESSOR BERESFORD PITE.

may be said, quite without doubt, that no
ber of the profession will be more univers-
and sincerely regretted than Paul Water-
se. The shock of his sudden removal last
ay scarcely enables one to realise either the
to architecture or to friendship which has
created by his unusual qualities and value ;
ities of a subtle charm of personality and of
ure, which, together with a standard of
ght and practice, made contact with him an
iring pleasure.

part from their artistic quality the person-
es of architects who attain success and
ership have special interest to their brethren.
l Waterhouse had a distinction of character
would have assured him success in other
s than those of the professional architect.
had an attractive sagacity, width of interest
racy humour, evident alike in conversation
in literary composition, and was entirely
poilt in spirit either by business cares or
cess. To his professional friends he was
ays the happy man without enemies or rivals,
l it was clear that the joyous and free
it had resources in home-life and in
llectual and spiritual friendships that
e strong and constant.

Ie found pleasure in describing his pro-
ion as ancestral, and was highly sensi-
of discriminating appreciation for
work of his distinguished father ; in
se days this critical justice is somewhat
r than, without much doubt, it will be-
e in the future. To those whom he felt
erstood the architectural qualities of
ancestor he naturally responded.
ugh the two architects, father and son,
e, as is not unusual, contrasts, physic-
and architecturally, both manifested
erited qualities of power and character
ch have made their family remarkable.
should be taken into account that the
ier was President of the Institute of
hitects, and his brothers respectively
he Institute of Accountants and of
Incorporated Law Society, and it is
significant that the mother was sister
Hodgkin, the historian. That such
estry is continuing to bear witness to
f can well be believed.



aul Waterhouse was at first unduly
lest in his expectation of holding the
t practice which he inherited, but it
not long before he justified his name
is clients. In his designs for buildings
ontact with or in addition to his
er's, he apparently felt the defer-
al wisdom of taking his own line, and
ded a comparison that would be im-
s; but the son can be observed as the
ectful though independent follower.
is tastes and gifts were dedicated to
rofession and they necessarily ensured
osition among his brethren. In a peculiar way
as fitted for the Presidency of the Institute ;
might say designed to ornament the chair.
obably no one else at the period could have
t so successfully with its urgent difficulties.
artiality, shrewdness and the saving grace of
our were displayed in conducting discussions
tended to acrimoniousness in these very
blous times. But this success is a minor
negative part of the record. His formal
resses and the many speeches that he made
he allied societies as President were always
inal and pungent, philosophical in tone,
resting in matter, and the evident work of an
mplished essayist. The more private and
onal, equally with the public, responsibilities
he head of an important profession were
lled without mistake, and it would not be
to say that he was a perfect head for an
itectural society.

hat the public leadership of the profession
undertaken and fulfilled with conspicuous
cess by a man of Waterhouse's gifts has
ved directly not only of great advantage to the Institute, but indirectly to everyone who professes and calls himself an architect.

It is little more than a year ago that his friends showed their appreciation of his services to the Institute at a special gathering, when an address and a replica of his portrait were offered to him, and it is but a few hours ago that on the morning of his sudden death they all received a delightfully characteristic note of thanks for the accomplishment of this gift—a gift which must now have its constant use.

Waterhouse's zeal and thoroughness were especially shown in matters connected with the improvement of London. He read a remarkable paper to the Institute upon the Traffic Commission Report of 1905, submitting plans that had involved much study and labour. Later on he gave similar help to the London Society's proposals for improving the south side of the river, and found time out of his busy life to undertake one of the suburban district maps.

When Chairman of the Institute Board of Architectural Education he was ungrudging in attendance and in acting as external examiner. The conduct of the business was constantly eased by the chairman's offer to write an explanatory letter, which must have been as pleasant to the patient as it was convenient.

The Late Paul Waterhouse, PP.R.I.B.A.
[From the painting by Sir William Orpen, at the Royal Institute of British Architects.]

"Wisdom strengthens the wise more than ten men that are in the city," is a text to which Waterhouse's goad-like words often gave point. His loss will continue to be felt in the controversies which still beset the profession which he loved, and in which his many friends look back to his example with pride and affection.

In 1891 Mr. Waterhouse was taken into partnership by his father, and after the retirement of the latter in 1901 continued and completed some of his father's works. He had helped his father in the designing of St. Margaret's School, Bushey, and Rhyl Hospital, and he completed University College Hospital, which his father had designed in 1897. He also altered the interior of the hall at Balliol. On his own account Paul Waterhouse designed science laboratories for Oxford, Manchester, and Leeds Universities, and University College Hospital Medical School and Nurses' Home in London. Among his ecclesiastical buildings were the Convent of the Incarnation at Oxford and All Saints' Church, St. Andrews. He did a large amount of work for the Prudential Assurance Society and for other assurance corporations, also for banks, including Lloyds and the National Provincial, for which he erected buildings in Paris and Brussels. In domestic work he had a large practice. As President of the Royal Institute of British Architects in 1921–23 he was a leader in the movement for the unification of the profession, and as chairman of the Board of Architectural Education he gave a large amount of time to the establishment and support of the various Schools of Architecture throughout England and Scotland. He took considerable part in town-planning activities, and was an authority on the complicated problems of the London bridges.

Mr. Waterhouse married, in 1887, Lucy Grace, daughter of Sir Reginald Palgrave, K.C.B., and leaves one son, Captain Michael Theodore Waterhouse, M.C., who has followed his father's profession, and two daughters.

The funeral took place at Yattenden, Berkshire, on December 23.

Mr. Paul Waterhouse was born on October 29, 1861, the eldest son of Alfred Waterhouse, R.A. His mother was Elizabeth, daughter of John Hodgkin, and sister of Thomas Hodgkin, the historian. From Eton he proceeded to Balliol, and obtained a second class in moderations and in *Lit. Hum.* As a student he was one of the R.I.B.A. prizemen, winning s silver medal for an essay.

THE LATE JOHN SLATER

We illustrate on page 1006 an address presented to the late John Slater, F.R.I.B.A., by members of the Royal Institute of British Architects, on June 28, 1923, signed by many of his friends. Some particulars of Mr. Slater's career were given in our issue for December 5, and a life-long friend now writes :—

"The death of John Slater is a loss to the architectural profession which it will be hard to fill, as he had the well-balanced and judicial mind which is necessary in dealing with many of the complex questions which arise in the conduct of an architectural practice in these times when everything appears to be more difficult than was the case years ago. He was respected by everyone who came in contact with him; personally I had the benefit of his advice on many occasions, and always found his exceptional knowledge of the very greatest assistance. As Chairman of the Practice Standing Committee for two years recently he dealt with the many questions put before the Committee with an impartial mind which was invaluable to the members of the Committee, and also to those who asked for advice. He was a man after my own heart, and his loss is greatly to be deplored."

Peterborough Cathedral.

Mr. H. F. Traylen, F.R.I.B.A., lectured recently on "The Architecture and History of Peterborough Cathedral" in St. Peter's College Hall. Mr. Traylen, in the course of his lecture, spoke of the ravages of the "death watch beetle," and described the way in which they hatched, became grubs, and transformed into beetles when they had eaten their way through the grain of the wood. The death watch beetle was to be found in nearly every old church, and at times the beetle was found in quite new wood. The only thing to do with wood when the death watch beetle was found in it was to burn it.

CORRESPONDENCE

Architectural Education.

SIR,—Professor Budden, in his lucid and soundly reasoned lecture on "The Future of Architectural Education," delivered recently at a meeting of the Edinburgh Architectural Association, made out a strong case for the University training and status of the architect. Although he dealt exhaustively with the certainty of the enhanced prestige it would give the profession, he did not deal much with the effect it would have on the future development of architecture as an art. His brilliant analysis of the metaphysical and psychological aspects of the question in his Silver Medal essay on "The Theory of Architecture" last year (which gave such delight to students of architecture) shows, however, that he is thoroughly conversant with other aspects of the question than the educational and economic.

Is it certain that a system which is considered a success in France and America would produce satisfactory results here? We are by nature, probably, more individualistic than any other nation, and the danger of the new system would be to reduce the practice of architecture to a matter of mere intellectual adroitness. In his essay on "The Theory of Architecture." Professor Budden admits that "solutions of architectural problems are intuitive rather than intellectual and logical." (This is very obvious, as seen by the study of old work.)

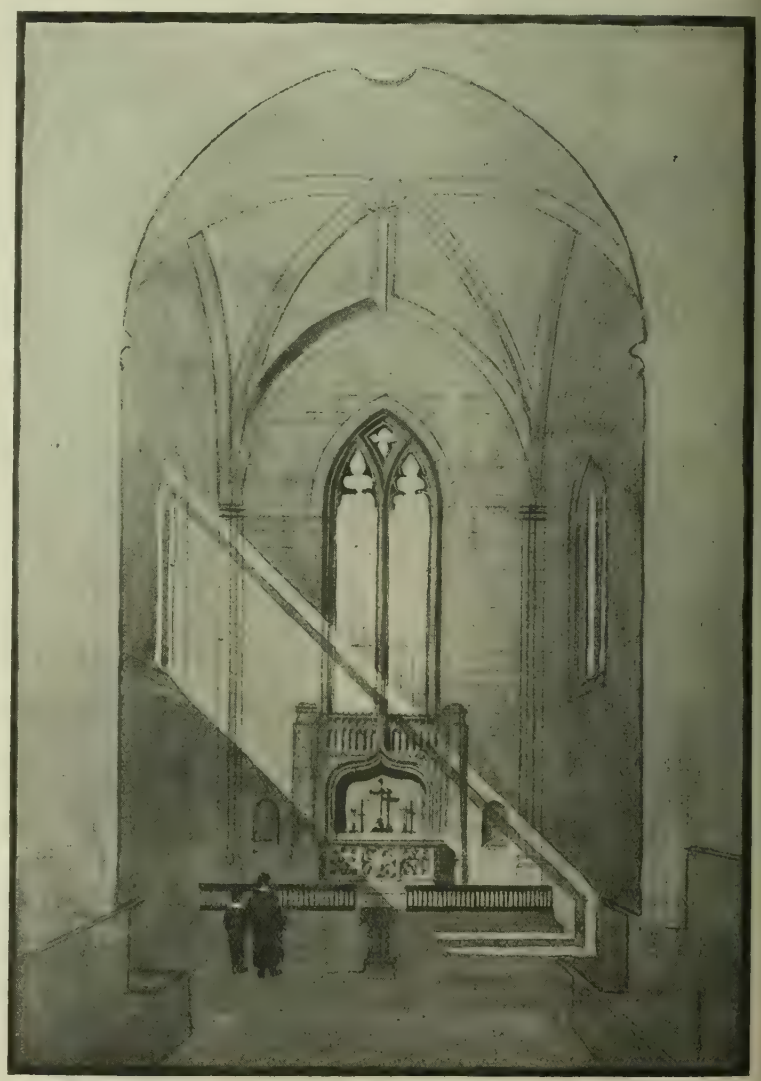
The "Mystery of Rightness" in design (to quote Henry James in speaking of the Parthenon) is something infinitely more than a question of graphic statics and applied mechanics. What did the builders of Durham, Ely and Lincoln know of these things? We have seen in other walks of life (Law, Medicine, and the Church) that the tendency of mere academic education is to sterilise the imagination, and an architect must ever be a theorist, an adventurer, an experimentalist and an artist.

Referring to the increased status given by a university degree, it might be well to point out that the university education of school teachers has greatly reduced the value of M.A. and B.Sc. as degrees, although it has led to the financial improvement in the condition of teachers. In mediæval times traditional evolutionary standardisation existed in such a definite form that no special thought was needed or given to the question of education in architecture. Everybody had an interest (through the crafts) in architecture, and such works as Dalmeny Church, West Walton, and the Pilgrim's Chapel at Walsingham were taken as a matter of everyday course. Now everything is in danger of being reduced to a question of intellectual analysis and formulas.

The success of mediæval work (indeed all early and primitive work) may have been largely due to the limited means of expression through speech because of a limited vocabulary. The mediæval rustic had a range of probably not more than 300 words with which to communicate his ideas, and so he found his main outlet for self-expression through his art and craft. To-day we live in an atmosphere of wordiness. It is less laborious to talk than to work, and requires less real knowledge and original ability. Is it certain that a five-years' intensive course at a university, supplemented by two vacational periods of six months in an American office, will produce the same high, scholarly artistic quality of attainment as the more leisurely pupilage system, with its Continental measuring and sketching tours, studying the choicest examples of the works of the great masters? Waterhouse, in one of his addresses on Education, stated that "Drawing from a building, if conscientiously done, is the finest and deepest form of study." Within limits this is true.

Again, Blomfield, in his recent obituary notice of Jackson (speaking of to-day), says: "The architect and scholar is somewhat at a discount. . . . Nowadays a rush to the Continent or America is considered adequate, with the result seen in the design of most of the commercial buildings of the present day." In Scotland, at least, it is highly improbable that university-trained men after a five-years' course will at once, on entering an office, receive such salaries as Professor Budden mentioned, viz., £6 to £9 a week. (Failures would probably become ghosts for less.) One danger of the university system is that ultimately the provincial universities and schools will be staffed by men from the university with the greatest architectural reputation, and so the course will tend to become more and more standardised, to the detriment of national and local traditions. Scottish architecture has a distinct character and tradition of its own, and the appointment of English professors in Scotland will tend to destroy the national development along traditional lines.

Again, if all teachers of architecture are to be practising architects (the R.I.B.A. ideal), the profession will lose much on the scholarship and research side of its art. If we have no successors to such men as Lethaby, Pite, and Baldwin Brown, our art will certainly be the poorer for it. The influence of such men, in educating the general public alone, to appreciate architecture as an art, is very great, and this aspect of the question must by no means be lost sight of. Endless controversial questions might be raised, but the obvious conclusion of the whole matter is (as Professor Budd mitted) that here, as in France, work provinces will fall more and more in hands of the speculator and builder—a of things we have already regretted. Medicine, and the Church are not abs parallel cases in the matter of Regist



Architecture is a creative art, and a cannot be reduced to a matter of me aminations; and, as Professor Budden s his "Theory of Architecture": "The is full of persons calling themselves a who have all the technique of externali and nothing to externalise." Here lie greatest danger of the academic progra It is the inward vision which makes the not mere technical excellence.

ARCHITECTURAL EDUCATION.—IV

By W. S. PURCHON.

HE following outline notes on the teaching study of certain of the subjects in a course rchitectural education are of a tentative acter, and are put forward as a basis for ussion. They are intended, in the main, to ly to the full-time day schools, but it is ed that they may also be found of interest to se who are teaching or studying in other ools, and to those who are obliged for various sons to study privately.

The History of Architecture.

t is by no means easy to decide on the best -division of this subject into the various rs of the course. There is a more or less eral agreement that, apart from special study the purpose of a thesis, and the general study ich large numbers of architects continue as sult of their interest in architectural history, s subject should be dealt with in the first ee years of the course, while some would limit to the first two. Could this subject be con- ered quite apart from its influence on other nches of architectural study, which would course be absurd, it would be an extremely ple matter to deal with its sub-division into years of the course, for then we could take cient, Mediæval, and Renaissance (including dern) in each of the first three years respec- ely. A second method is that of taking cient and Mediæval in the first year, with naissance and Modern in the second. Both above methods have one great disadvantage, until the student has some knowledge of the naissance it is difficult for him to begin archi- tural design, and most would agree that tart in this should not be postponed beyond beginning of the second year. It therefore ms wise to deal in outline with the whole of main field of architectural history during the t year, and to take in further detail Ancient l Renaissance architecture in the second year. some cases a detailed study of Mediæval hitecture may be arranged as an alternative. further method, which certainly has dis- antages as well as advantages, is to take cient architecture in some detail in the t year, together with an outline of Mediæval l Renaissance, and to work in the second year a more detailed study of the Renaissance in ly and France and of Mediæval and Renais- ce architecture in England. A short course special study of the architecture of the last years may perhaps be taken in the third r, possibly in conjunction with a series of ures on the theory of design.

istorical work should all be strongly influenced the fact that it is leading to modern design, so much by the process of acquiring details reproduction but rather by the study of tions of old problems acting as a guide ards the solution of new ones. Each build- studied should thus be looked upon not so h as an interesting and possibly romantic , but as one which in its day was brand new, which aimed at satisfying certain human ls and aspirations. Its construction should tudied; its plan, section and elevation, and expression of function. It should be con- red as a piece of architectural design in con- tion with the social conditions of its time place, the materials available, the special atic and other conditions, and the require- ts it aimed at fulfilling. It is very helpful n attempt is made to show to what extent it eeds as a solution of a definite problem. s type of study should, however, not be ted to a consideration of isolated and lated items, but rather to the progress of itecture on the lines indicated, as, for nple, the development of the church plan ng the Italian Renaissance. While a con- rable amount of reading, and a certain unt of writing must be done in these studies, very important that a large proportion of work be done through the medium of general detail sketches approximately to scale, and, urse, every possible opportunity of studying hy buildings on the spot should be taken. The constant making of such sketches, together with frequent attempts to reproduce them from memory, is surely of great value to our students, particularly in the early years of their courses of study, and especially if it is made clear that while it in no way takes the place of design it is a step toward that end. General histories of architecture should in all cases be supplemented by study of books on various periods.

Architectural Construction.

One might prefer to use the term "Building Construction," but, unfortunately, while all architecture may be building, all building is not architecture. It is strange, too, that many students who produce presentable work under the heading of architectural history or design, apparently change in character in Jekyll and Hyde fashion at the mere mention of "Building Construction." There is, indeed, little the matter with the latter term beyond the fact that for so many it appears to connote anything but architecture; we might perhaps continue with the long effort to persuade every one concerned that "Building Construction" refers to good and not to bad building; but it will probably be more effective, and certainly simpler, to use such an expression as Architectural Construction, or Constructional Design.

While it is necessary, for certain purposes, to keep the two terms distinct, it may possibly be helpful to look upon construction as a branch of design—the designing, that is, of the making and putting together of the various parts, small and big, which go to make up the whole. It would certainly appear wise to avoid emphasizing the distinction between design and construction, and to avoid exaggerating the differences between what may become to be known as "constructional" buildings and "design" buildings.

In order to deal with the subject systematically, it seems clear that there must be definite courses of lectures on architectural construction during at least the first three years of the course, divided into two sections, applied and theoretical. In the first year, the "applied" lectures might well lead to the preparation of a set of working drawings of a small building, based on, but not reproductions of, a set for a building previously erected; while, in later years, working drawings of buildings and parts of buildings designed by the student should be similarly prepared. In the third year, particularly, it seems advisable for the students to do a proportion of their one-day "designs" in working drawing form. The preparation of full-size details should be started as soon as possible, certainly during the first year of the course. In connection with the "applied" lectures, the subject of materials should be introduced from the beginning, and while special courses of lectures on materials will be found necessary in the third year, and probably again in either the fourth or fifth, during the first two years they are probably best taken in the course of lectures on construction, as far as possible as each new material is introduced into the problems.

In an early part of the course, possibly in the second year, special lectures may with advantage be given on some such subject as the chemistry of building materials, geology as applying to building stones, or laboratory courses in the testing of strengths of materials. It may be that it would not be possible to include all these subjects in any one course, and probably in no one school would the facilities exist for teaching all of them; but genera ly one or two of them could be included with advantage.

It should not of course be overlooked that much useful knowledge of construction, material, &c., can best be obtained by visits of inspection to buildings in progress, to places where building materials are made, worked or quarried, and by the sketching and measuring of existing buildings. Opportunities for experience in these directions should therefore never be missed. With reference to the preparation of measured drawings, it is particularly noteworthy that, unless special guidance is available, students all too frequently refrain from noting information on such subjects as masonry, jointing, &c., which would be invaluable to them in later years.

The Calculation of Structures.

This is a subject which usually presents difficulties to the student, probably because, in some cases, it is not dealt with sufficiently systematically, because at first the application of it to his work may not seem obvious, or because the student is not sufficiently acquainted with mathematics and mechanics. In some schools, a course of mathematics is given in the first year, one on mechanics in the second, and the calculation of structures started in the third; but it seems advisable to omit the special course on mathematics, or to include it with mechanics, so that the latter may be taken in the first year, and theoretical construction studied in the second. The first course on theoretical construction would be followed by a more advanced one on structural steel and reinforced concrete, taken in the third or fourth year, so that either in the fourth or fifth year (preferably, perhaps, in the fourth) a set of working drawings could be prepared from calculations made by the student.

There are, no doubt, differences of opinion on this subject, but, broadly speaking, it would seem advisable not to exaggerate the possibilities in this direction for the student of architecture. He cannot, normally, be an expert in structural steel and reinforced concrete, and if he is made into one he will probably not be an architect. It, therefore, seems wise, except in very special cases, to limit the calculations of structures to buildings of modest dimensions and to those which do not present the special difficulties which are, after all, the province of the expert.

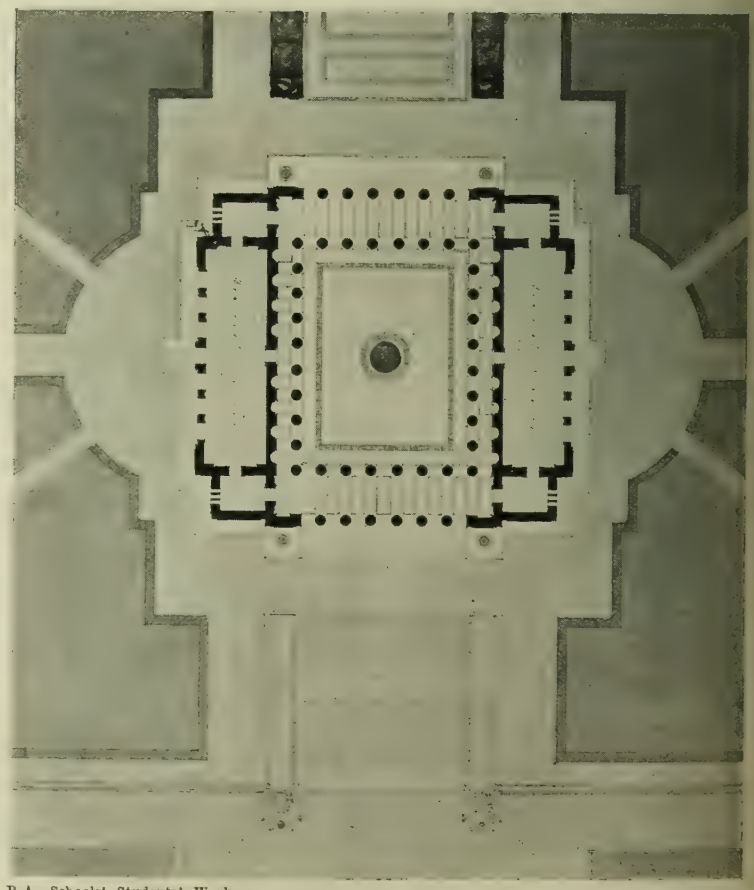
Sanitation.

During the first three years of the architectural course, probably in the third year, a short introductory course of sanitation, including lighting, ventilating and heating, appears to be necessary, so that, by the end of that period, the student will be able to deal with that subject so far as it concerns small buildings. It may, by some, be looked down upon as an excessively utilitarian subject, but it is clearly of very considerable importance, and in its wider aspects, which might well be emphasized from the beginning, is closely allied with town-planning. A more advanced course is clearly necessary in either the fourth or fifth years, and where it is possible, as is the case in certain schools, to engage the services of experts in such branches of the subject as heating, ventilating and lighting, this should certainly be done. It is clearly advantageous for students to be introduced to the main principles of this work on the soundest possible lines.

Acoustics.

A similar comment to that in the preceding sentence applies very definitely to this subject. Considerable developments may well be anticipated in the near future, and all students of architecture will be well advised in keeping in close touch with a matter which affects our art profoundly.

Specifications and Professional Practice.



These subjects are normally dealt with in the fourth and fifth years. While it may be said that it is only in actual office experience that such matters can really be learnt, it seems clear that there is room in the schools for courses dealing with these subjects, and particularly with the principles which are at the back of them. Such courses will doubtless be of considerable value in helping the student to continue his study of these matters on right lines when he leaves the school for the office. The course on specifications fits in well with the advanced course on materials to which reference has already been made, and while, during his course on Professional Practice, the student will deal, among other matters, with the Building Acts, it should be said that the latter should be brought to his notice early in his course, and that he should constantly use them to check his working drawings.

THE CONFLICTING OPINIONS AS TO THE DATE OF WALTHAM ABBEY CHURCH

By the late W. de GRAY BIRCH.

The peculiar features of Waltham Abbey Church of Holy Cross are probably unique in the history of British architecture. Much has been written about the building, and some of the most prominent architects have propounded theories at variance with each other to account for the remarkable evidence it offers to investigators. One of the points which should be taken into consideration seems to have been entirely overlooked. It occupies a position at the meeting of the streams of history, being at the exact line of intersection between Anglo-Saxon and Norman architectural styles, just as the great tower at Evesham stands as the very last Gothic example reared before the inrush of the Palladian or Romanesque fashion of the middle of the sixteenth century. Second to none in beauty of workmanship and wealth of design, a marvel of what stone can achieve, the mind of the designer and the hand of the mason, a close rival to Durham, and to Rochester in its best day, Waltham still awaits the unravelling of its *ensemble* and the discomfiture of most of its critics. One of the most lucid accounts which are before us is from the pen of the late Charles Lynam, F.R.I.B.A., F.S.A., of Stoke-on-Trent, whose name and architectural fame claim from all students and experts in ecclesiastical art the highest respect and reverence. Lynam carefully examined the ruins of Waltham by the light thrown upon them by the expressed opinions of William Burges, E. H. Buckler, Arthur Ashpitel, Professor Freeman, J. A. Reeve (the architect of the church), Rickman, and other antiquaries, but no one seems to have valued the fact that as this building was professedly raised by or amplified from the original church built by Tovi in 1030, as a memorial of Harold, the last monarch of the Saxon dynasty, it was more likely to have derived the inspiration of its design from a Saxon than from a Norman architect—a Saxon who would be of mature age and occupying a high position in his calling, and yet to some extent biased in his leaning towards what was at that date the newly-introduced Norman style which had come to supersede our insular tastes by the introduction of a more advanced and ornamental taste. Harold is recorded to have pulled down Tovi's church and built a new one of great magnificence, consecrated by the Archbishop of York on May 3, 1060, in the presence of Edward Confessor and his queen. Two years later the King established a college for canons secular. The existing west wall of the south transept very probably shows, states Mr. Reeve, the exact projection of the transept of Harold's church. It is this blending of feeling which compels, unconsciously, Lynam to say at the end of his notice: "What . . . is significant is the fact that not a single mark of Saxon design or workmanship, as commonly understood, is present, except, possibly, in the lower part of the eastern face of the south transept west wall and the external rubble facings in the south aisle. But, on the contrary, the design and the workmanship and the ornamentation are all essentially Norman, and in all probability Norman oversight controlled the work."

This ruined church is but a fragment of the great conventual establishment which in the eleventh century occupied the surrounding site. The head, arms, trunk, are gone, all that is left is, as it were, but the stump of a tree rooted indeed at the time of one of our historical cataclysms, revived at the commencement of a new and foreign rule, nurtured by the dominant powers of the land for nearly five hundred years, but finally reduced to an appalling ruin. Rude, as it has been thoughtlessly called by some less enlightened thinkers, "a study of its details will," writes Lynam, "reveal in its construction, delicacies of proportion, refinement of design and beauties of ornamentation which the most cultured of the lovers of art must appreciate and admire." The present church consists, on plan, of the nave and aisles of the Norman church, the two eastern bays being used as a chancel; a chapel on the south side of its eastern end in a line with the east end of the nave, and other modern additions we need not take here into notice. Beneath the south chapel, for its full size, is a crypt. The main entrance to the church is by a doorway in the west wall of the tower, and there are ten other entrances, detailed by Lynam, leading to the interior. The dimensions are so well-known that it is only necessary to say here that the length from east to west within the walls is 108 ft.; width of nave, 23 ft. 8 in.; of north aisle, 9 ft. 7 in.; of south aisle, 9 ft. 10 in. from wall to piers; and height of nave to ceiling, 52 ft. Here occur also, as at Birchington Church in North Kent, at Copford Church, near Colchester, Essex, and no doubt many other churches, certain indications of change of original intention on the part of the builder. The aisles of Waltham have lost their first proportions, for Lynam finds that "they were assuredly spanned by appropriate vaulting," shown by "the shafting on the aisle side of the nave piers, strings under the aisle windows with gaps," and what else but vaulting shafts account for the present appearance of the aisle walls where the inner quoins of the vaulting shafts still appear. Freeman points out indications of special provision of increased thickness in walls in reference to two western towers which originally occupied the position, and in the western bay no clerestory was provided, and there is nothing to suggest that towers did not form part of the original façade. The first material change of design was the removal of the west wall and the substitution of the present one. We may compare this proceeding with what happened at Peterborough Cathedral, where a wide horizontal strip was simply deleted from the ori design for the west front. Lynam thinks the western front of Rochester Cath represents the probable characteristics of original Waltham front. Rickman assign Waltham the date of 1066 to 1199, and opinion has been usually, but not univers adopted by later investigators; and B finds "no sign of any very early work at tham." In another place Burges puts on re the following of his previously-menti opinions: "I am induced to believe Harold's church might have ended at the apse (on the plan) and that the subse Norman addition comprised the transepts a choir," etc. On the other hand, J. A. F lays down his opinion that from the west up to and including the second pier from east end on both sides of the nave we Harold's work—perfect on the south side perfect on the north side up to the string-c below the clerestory, the remaining por being of the time of Henry I. Freeman co "though not without doubt and hesitatio the conclusion that the balance of evi inclines to the opinion that the Romane portions of the present church are really por of the original church built by King H . . . . at latest at 1060." The writer modifies his words with, "By whoms built, Waltham Abbey is undoubtedly a No building." Lynam contrasts the Priory C of Tutbury in Staffordshire, which was menced in 1080, and the founder, Henr Ferrars therein interred before 1090, a cl not unlike, in its general aspect, to Walt and its details even favour an earlier char than this Abbey Church. Here we leav controversy to be settled by the ligh comparison and investigation. In decidin true date of the church, before the altera and improvement, we are bound to take consideration the value of the antique re and the traditional history as given by chroniclers of the eleventh and tw centuries.

R.A. Schools' Students' Work.

Design for a Propylæum.

By Mr. H. E. Furse (awarded Landseer Prize (£20) and Silver Medal for an Architectural Desi

DOMESTIC ARCHITECTURE OF THE AMERICAN COLONIES

e expression "Colonial Style of America" become familiar to British architects as of the propaganda of a movement in rn housing away from the sham Mediæval back to a more reposeful Georgian school. ssor Fiske Kimball's excellent book* rates many fine examples of the application ssic design to domestic work, and readers ld find in it an eloquent argument in favour al simplicity and directness in domestic tecture. Fashions will change and change , just as they are returning upon themselves in this present instance to the work of or three generations ago, and it would be if common sense and a keen eye to conence might inspire all efforts. Although ished at a moment when its subject-matter ens to have both a topical and a practical est to English home builders, the book is ten in an historical rather than a propalist mood, and if on the whole it is calculated trengthen the hands of the Neo-Georgians eir practical campaign, it nevertheless gives ath blow to many widely accepted theories. origin of the log cabin, for instance, used to an obvious matter. It was natural to ose that the early colonists found it easy woody country to fell trees, notch them he corners, and pile them up in the form has become familiar from illustrations in urite story books. If any architectural ry possessed abundant weight and vitality y this was it, yet Professor Fiske Kimball's rical researches into what the early colonists ally did reveals an altogether different e of affairs, and at a word arrests the lerous momentum of tradition.

ne dwellings of the early settlers are illus- d by photographs of conical huts composed icks and turf such as were still being built England as recently as 1901 by charcoal ers and bark peelers. The pattern of the ers' huts was not even copied from the ans, but was brought to America by the nists who had themselves either lived in huts, or had been familiar with their use heir poorer neighbours in the old country.

ren with the building of more substantial es the framed half-timbered house of ish Tudor type seems to have preceded the abin, of which the author writes: "A more onable supposition is that the log house was ght to America by the people in whose ve land at that time it was the customary of dwelling—the Swedes and Finns who ed on the Delaware in 1638 and the years wing. Peter Kalm, writing in 1749, and ing a settler ninety-one years old, describes first houses as of round log chinked with and contemporary accounts describe the built at New Gothenburg in 1643 as made of lock beams laid one upon the other."

nother widely-diffused theory with which essor Fiske Kimball finds himself in opposi- is that the elongated forms of certain rican versions of the Columnar orders were red by the use of wood for their construc- Early examples of orders used in Ameri- houses are, however, of approximately ic proportion and it was not until after the of the formation of the Republic that the on for attenuated shafts became at all ounced. In this connection it is a significant that the researches and example of the hers Adam—who introduced elongated ts into English practice—took place at a enient time to direct Republican America in attainment of its classical ambitions.

uring the colonial period the mediæval forms abled frame-houses with their overhanging r stories, their low rooms, and their construcal survivals from Gothic times, had gradually been supplanted by houses of a more spacious character. Elevations were developed with more symmetry, roofs erected with a lower pitch and balustraded parapets and flat deck roofs over at least a part of the house came into general use. In planning, the size and height of rooms was increased as time progressed; privacy was taken into consideration in the arrangement of stairs and halls, and, with the introduction of brick, chimneys were placed more in accordance with the dictates of convenience instead of being gathered together in one bulky wood-framed clay-lined stack.

Further developments in the art of planning for convenience are to be seen in examples of the post-colonial period, but a renewed interest in the exact details of classic art in the last quarter of the eighteenth century was often allowed to take precedence of mere utility. Planning had escaped from the compulsion of penury only to fall into a worse thraldom to the classic symmetry of ancient temple architecture and the tyranny of the orders. Professor Fiske Kimball makes it clear that the gilded chains were willingly accepted and proudly worn. The ideal of classical form appealed to the Republicans who "identified themselves with the heroes of the Roman republic. . . . Leaders of thought in the 'thirties had a consciousness of solidarity with ancient Greece which touched every department of life."

Certain architects in America could design new works in the light of the personal experience of classic effects gained in the course of their travels and studies in Europe but the excessive love of classicism may have been encouraged by the very difficulties of access which prevented recognition of any weak points in the original buildings in Italy and Greece. Ideas gained from the text-book have extraordinary force in that they are not subjected to immediate contradiction or brought into contact with mitigating circumstances. "Books were of less relative influence than in the colonial period, but remained much in use. The amateurs and craftsmen were still dependent on them for forms of detail, and now drew upon them more often for the arrangement of the ensemble. No less than four of Pain's works were republished in America before 1804."

Special English and Continental works on ancient Grecian and Pompeian art followed, and Classicism succeeded in abolishing the old colour interest of materials. Expanses of paint or stucco ruled to imitate masonry were substituted for the older red brick. Clapboard and shingles upon the façades of houses were replaced by smooth boarding with close joints with the same objective of Classic propriety in view.

Progress with the internal arrangement was not lacking, however, and orientation and aspect received attention, the valuable sunny south frontage being reserved for dwelling rooms instead of being inconsiderately given up to halls or stairs. The pass pantry, characteristic of American domestic architecture, even in the present day, made its appearance soon after 1800 and was situated either between kitchen and dining-room, when these rooms were on the same floor, or between the dining room and a landing of the service stair.

From an early period economy of first cost had been guaranteed by disposing the accommodation as nearly as possible into a cubic form, but the demands of Greek temple architecture were incompatible with any such commonplace consideration, and after the Greek War of Independence (1821–1827) the colonnaded front of an American house was liable to cost as much as the house itself.

With the temple ideal in view the flat roof was often abandoned in favour of a pediment, the difficulty of constructing a water-tight flat with the materials then in use supplying a practical inducement for the change of style. A comparatively steep form of pediment was adopted in most cases, so that it would fit at the end of an ordinary low-pitched roof, and in this respect the revived Greek work of America has less of artificiality than is so frequently to be observed in buildings of a similar style in England.

In spite of a relapse into Romanticism—a domestic counterpart of England's Gothic Revival—and an acknowledged vernacular tradition uncouthly misnamed the Dutch-Colonial style, American architecture has again returned to the Classic style, which is not unsuited to the geographical situation and climatic conditions of a great part of the United States, and in which the democratic aspirations of America found their fitting expression.

A great deal of detailed information in regard to chronological sequence of remaining early houses, the works and names of famous American architects, and methods of design and construction, are included, together with over two hundred illustrations, an index and a series of notes on individual buildings.

SHEFFIELD SOCIETY OF ARCHITECTS

Professor Beresford Pite, F.R.I.B.A., lectured recently at the Sheffield University, before the Sheffield, South Yorkshire and District Society of Architects and Surveyors, on "The Architecture of Concrete Building."

In the course of his remarks Professor Pite said architecture was either conscious or unconscious, natural or artificial, the work of the constructor or the work of an artist. This definition would generally correspond with Gothic or Classic. The Renaissance tried to be both at once. An affectation of character which might be at once an artistic and artificial imitation. It was a truth, a realised fact that unaffected simple construction eventually attained an æsthetic value; in process of time that in it produced architectural joy. When they looked at modern ferro-concrete construction it was their hope that sooner or later it would give them the same satisfaction that unaffected Gothic building afforded.

In the absence of any sense of pleasure in beholding modern concrete buildings they must fall back upon the qualities of simplicity and impressiveness of scale and of that expression of purpose which was always interesting, and await the advance of a sense of beauty. Adornment detracts from such interests. Simple bridges were better without ornament, they illustrated the interest of constructive expression and the forces at play in the construction. Architects could mock this spirit and play with it. This might be illustrated from many buildings at the last Paris Exhibition, where playfulness abounded. It was their duty to put architecture in its proper place. The progress from prehistoric construction from the primitive Greek to advanced Roman, from Norman masonry to the vaulting of Edward VII Chapel at Westminster, would show how ideas progressed from simplicity to a complex beauty, combining artistic construction with constructive expression. They must combine the simple expression of ferro-concrete construction with their artistic enjoyment of traditional forms, using these negatively as well as positively. This modern French ferro-concrete had done with success. Their heavier Saxon ideas moved in larger masses and were not yet very playful, but they did not live in the past and should seek for freshness and find a stimulus to imagination in the new use of thinness instead of thickness. Self-contained thrusts instead of abutments, and in the consequential new proportions; remembering that naked facts could never be wholly satisfactory, that clothing and ornament were necessary, and for these they must look for historic architecture in dealing with concrete buildings.—A vote of thanks to the lecturer was proposed by Mr. F. E. P. Edwards, seconded by Mr. J. M. Jenkinson, and supported by Professor Husband and Mr. J. Amory Teather.

LEGAL SECTION

NOTES ON CURRENT CASES

Repair of Bridges.

An interesting point has been decided in the recent case Regent Canals and Docks Co. *v.* Gibbons (*Weekly Notes*, October 25).

In 1900 the defendant's predecessor, an owner of land in Willesden, desired to make a road between two existing highways, and to do this it was necessary to construct a bridge over the canal feeder belonging to the plaintiffs' two canal companies. He obtained permission from the canal companies to make the bridge on making certain payments and on entering into a covenant that he would maintain the bridge "until the said road and bridge are taken over and maintained by the local authority."

Until his death in 1914 he had fulfilled the covenant, but in 1915 the local authority, by notice under section 152 of the Public Health Act, 1875, had declared the road to be a highway repairable by the public at large, but no steps had been taken to declare the bridge a "county bridge." The plaintiffs were claiming a declaration that the defendants, the executors and trustees of the landowner, were liable to maintain the bridge, but the defendants said their liability had determined as the bridge had been taken over by the local authority.

Section 4 of the Public Health Act defines "street" as including any highway and any public bridge, not being a county bridge, and any road, and the Court held that the act of the local authority in declaring the road which passed over the bridge to be a highway repairable by the inhabitants at large was "a taking over" of the road and bridge within the meaning of the covenant and put an end to the defendant's obligation to repair the bridge.

Another case of importance as regards bridges is the decision of the House of Lords in an Irish case, Attorney-General for Ireland and Lagan Navigation Company (1924, A.C. 877). There the Canal Company by a special Act in 1843 was created to take over and manage a canal in Ireland and the undertaking included a bridge constructed before the Act to carry a public road over the canal. The bridge had been maintained by the Canal Company in a sufficient state of repair to carry the ordinary traffic at the date of the passing of the Act, but owing to the increase in the amount, and the alteration in the character of the traffic, part of one of the retaining walls of the bridge had collapsed and the road authority claimed to recover from the Canal Company the expenses incurred in repairing the retaining wall. Under the special Act it was provided that the Company should at all times during the continuance of the Act maintain and keep the said navigation and every part thereof, and all bridges, and all works, bridges, viaducts, preservation, retaining and other walls, fences and embankments upon, or connected with, all county or other roads made and constructed by the Company, and all works to be thereafter executed for the improvement thereof "in good substantial and serviceable repair and in an efficient state for all the purposes thereof and of the traffic on the same respectively." The duration of the private Act had by a subsequent Act been extended to 99 years.

Under the Act the works improvements and repairs had to be executed to the satisfaction of the Commissioners of Public Works in Ireland, and the Commissioners had power to inspect the state of repair and efficiency and to require performance of any repairs or works they considered necessary, and in case of any difference arising as to the manner in which the works improvements and repairs were to be executed the decision was to be left to an engineer appointed by the Treasury.

The question was whether the Canal Company was bound to keep the bridge and retaining and other walls in such repair, and in such an efficient state, as to sustain the present-day traffic, or only for such traffic as existed at the date of the private Act? The trial Judge in Ireland had held that the Company were bound to keep the bridge in repair for the present-day traffic, but the Court of Appeal in Northern Ireland had reversed this judgment, and the House of Lords by a majority of four to one affirmed the decision of the Court of Appeal. We cannot give the judgments delivered by the majority in the House of Lords in any detail, but can merely briefly summarise the effect of the judgments. The principle laid down in two cases in the House of Lords, Sharpness New Docks and Gloucester & Birmingham Navigation Co. *v.* Attorney-General (1915, A.C., 654), and Attorney-General *v.* Great Northern Railway (1916, 2 A.C., 356), is that if a statute which authorises works goes on to define what are to be the rights and obligations following from the execution of the statutory act, it is in the language of the Legislature, and that alone, that rights and remedies are to be ascertained. In other words, as we may put it, the common law is displaced. Those two cases in the House of Lords turned upon repairs to be executed on works created under the Acts under consideration, and it was held that, under the terms of those Acts, there was only a liability to maintain bridges constructed under the Act in a condition which would bear the traffic of the date when the Acts were passed.

There is this distinction between those two cases and that which the House of Lords have now decided, in that the bridge in question was not constructed under the private Act, but was in existence before that date, but the House of Lords held that as the private Act dealt with the two classes of bridges, *i.e.*, those already constructed, and those constructed under the Act in the same terms, it was impossible to distinguish between the two, and the same considerations applied to both. That is to say, the decision amounts to this—as regards a bridge built since the passing of the Act, the principle laid down in the Sharpness case applied, and it need, under the terms of the private Act, only be maintained in a state to carry traffic of the nature to be expected at the date of the Act, and as the language which applied to the bridge erected before the Act was the same, it was impossible to differentiate between the two, and the same degree of repair was all that was necessary. The claim of the road authority therefore failed.

Workmen's Compensation Dependency.

A case has recently been decided under the Workmen's Compensation Act of last year. Peart *v.* Bolckow Vaughan & Co., Ltd. (*Weekly Notes*, November 8). The applicant was the father of a boy of 14 years of age who had been killed, and he was claiming compensation on the ground that he was partially dependent on the boy's earnings. His eldest son, aged 16, was earning £1 0s. 6d., the deceased earned 15s. 3d., and there was in the family the mother and a child of 11, both of whom earned nothing. It was admitted that the deceased would have advanced by rapid stages to higher wages, and the County Court judge had held that although at the time of his death the injury to his father was small, yet as the boy, had he lived, would have earned increasing wages and would have contributed more to the common family budget, £50 added to the £15 for funeral expenses, which the respondents had already paid, would represent the sum which under paragraph (1) (a) (ii) of the Act of 1906 would be "reasonable and proportionate to the injury." The respondents appealed.

The Workmen's Compensation Act of last year in section 22 has introduced an alteration in the law. In section 13 of the Act of 1906 the word "Dependents" was defined as meaning "Such of the members of the workman's family as were wholly or in part dependent upon the e of the workman at the time of his de would, but for the incapacity due to the ac have been so dependent. . . ." This def was very similar in effect to that conta the original Act of 1897 and therefo decisions given under the first Act hav good under the Act of 1906, and in th Simmons *v.* White (1899, 1 Q.B. 100 Court of Appeal held that to make a dependent he must be shown to some to have depended upon the other for the or necessaries of life, having regard to his cl position in life, but in Main Colliery Co *v.* Davies (1900, A.C. 358) the House of rejected the doctrine that the standard of must be that of the neighbourhood and life, and held that the only considerations regarded were what the family in fact earning and what the family was in fact sp for the purpose of its maintenance as a Section 22 of the Act of last year contain following definition of partial depen "For the purposes of the principal Act a shall not be deemed to be a partial dep of another person unless he was dep partially on contributions from that person for the provision of the ordinary saries of life suitable for persons in his cl position." The Court of Appeal have h the case we are considering, that the ef this section is to restore the rule adopt determining dependency by the Court of in Simmons *v.* White, which was rejected House of Lords in Main Colliery Co *v.* Davies, and that the County Court Ju this case had acted upon it, for he was e in determining the question to take int sideration a future increase in the earnings deceased, and also to apply his own local ledge of the standard of living in a family.

The application of the rule as now em in this section may not effect a different d in all cases for in both Simmons *v.* Whi Main Colliery Co., the facts were som similar to those in the case under conside and in both the award was made in the cant's favour, but, of course, cases may a which the new rule now given sanction to section may make all the difference. Th been already foreseen by text-book w Mr. Willis, for instance, in his 22nd e published early this year, says, referring new section: "It is not easy to measu effect which this definition will have up whole aspect of the subject of dependen settled in the above cases" (referring two we have mentioned and others); "it duces, or seems to introduce, the very sta of living which was rejected as irrelevant House of Lords." It will be seen from wh have said above that this is the view whic now been adopted by the Court of Appeal.

That an arbitrator may take into cons tion a prospective increase in earnings w cided in Sheldon *v.* Butterley & Co., Ltd. 2 K.B. 600; *The Builder*, January 30, 1

Workmen's Compensation Weekly Paym

Another point of some importance und new Act has been decided in the cases, P *v.* William France Fenwick & Co., and Su Leach & Co., Ltd. (*Weekly Notes*, Novembe Section 14 of the Act of 1923 provides employer shall not be entitled otherwise th pursuance of an agreement, or arbitrati end or diminish a weekly payment unde principal Act, except in the following c The first case is where a workman has ac returned to work and the second is whe weekly earnings of a workman, in receip weekly payment, have actually been incre but this case turned on the third, contain paragraph (*c*) of the section, which pr "that the payments may be ended or dimi where the medical practitioner, who ha

d the workman under paragraph (14) of First Schedule to the principal Act, has ed that the workman has wholly or lly recovered, or that the incapacity is ger due in whole, or in part, to the accident copy of the certificate (which shall set he grounds of the opinion of the medical tioner), together with notice of the tion of the employer at the expiration of lear days from the date of the service of otice to end the weekly payment, or to nish it, by such amount as is stated in the e, has been served by the employer upon workman." But to this paragraph there is oviso (*i*) "If before the expiration of the ten days the workman sends to the em- r a report of a duly qualified medical itioner (which report shall set out the nds of his opinion), disagreeing with the ficate so served by the employer, the weekly nent shall not be ended or diminished pt in accordance with such report, or if so far as the employer disputes such report, pt in accordance with the certificate given medical referee in pursuance of paragraph f the said schedule as amended by this "

ow, in the case in question, two men had with an accident, and without any legal eedings or any recorded agreement, they paid compensation, in the first of the cases full compensation, and in the second irst full compensation, and then full com- ation for partial disablement. Subse- ntly, the employers, thinking the men to ecovered, had sent a medical man to examine n (this, apparently, being an examination er paragraph (14) of the principal Act), the medical men had in each case reported very. A copy of the medical certificate had n sent to the men, together with notice of the loyers' intention to stop compensation in days, but the men had not sent a certificate he contrary, under the above section, but r an interval had applied for arbitration. the arbitrations, the employers contended , as the workmen had not sent any counter ificate, they were now precluded from dis- ng the certificate of the employers' medical , and in Pudney's case this contention had affirmed by the County Court judge; st in Smith's case it was negatived; but oth cases, the judges had found that in fact men had not recovered.

he Court of Appeal allowed the appeal in first case, and affirmed the judgment in the nd case, that is to say, the Court in effect that the section was not compulsory, the men could still go to arbitration. The nds for this decision were that, under ion 11 of the new Act, there is now power for registrar to refer a matter to a medical referee r paragraph (15) Schedule I of the principal on the application of either party, and not oth as heretofore, but under that section there is power for the registrar to refuse the rence, and to send the matter to arbitration an appeal to the judge, and, therefore, Court considered that, under section 14 the proviso set out above, which gave rrelative right to the employer to dispute ertificate obtained by the workman without ne limit, it was impossible to interpret the iso as imposing an absolute time limit upon action of the workman which was to be a lition precedent to the workman's right to g the matter to arbitration.

he case is only reported at present in the of a headnote, and we confess we find it ult to follow the decision, as it seems to er the new section nugatory. Section 14 oduces a new provision. The employer shall be entitled to end or diminish a weekly nent unless he follows the procedure pre- ed. If the employer follows the procedure cribed, and he does not accept the report he workman's medical man, then, under graph (15), was concluded by section 11 he Act of 1923, the matter must be red to a medical referee. Pending this ence and report, section 14 of the new states specifically what shall be done the payments in dispute, and if the effect of the report of the medical referee is disputed, an appeal lies to the registrar of the county court, or the judge. The present decision as at present reported appears to enable the workman to ignore the new section, whilst leaving the employer compelled to adopt that procedure whenever he desires to end or diminish a weekly payment.

EJECTMENT ACTIONS, RENT RESTRICTION AND COSTS

A very important decision has been given in the case Gunter *v.* Davis (*Weekly Notes*, November 15) in an action to recover possession of a dwelling-house. (1) The plaintiff was the owner of a dwelling-house in Fulham, the rental value of which brought the premises within the Rent Restriction Act, 1920. The premises were let on a lease which had come to an end June 24, 1923, but the defendant was in possession at that date and claimed to be a tenant. The grounds upon which this claim was made are not given in the report, but Mr. Justice McArdie had decided that the defendant never had been a tenant and was a trespasser, and the defendant having previously yielded up possession, judgment was given for the plaintiff for mesne profits. It was then contended on behalf of the defendant that under section 17 subsection (2) of the Rent Restriction Act, 1920, the plaintiff was entitled to no costs as the action had been brought in the High Court. That subsection provides "A county court shall have jurisdiction to deal with any claim or other proceedings arising out of this Act or any of the provisions thereof, notwithstanding that by reason of the amount of the claim or otherwise the case would not but for this provision be within the jurisdiction of a county court, and if a person takes proceedings under this Act in the High Court which he could have taken in the county court, he shall not be entitled to recover any costs."

The case is only reported at present briefly in the form of a headnote, but the Court intimated that the point raised was a serious one, as if it was successful it would cut down the ejectment jurisdiction of the High Court in a very drastic fashion. This section was considered in Wolff *v.* Smith (1923, 2 Ch. 393; see *The Builder*, July 20, 1923), and the plaintiff in that case was a statutory tenant who was suing the landlord of the premises for an alleged trespass for which nominal damages had been awarded, and it was held that the section applied because to support the action for trespass the plaintiff must show his right to possession, and to do that he had to rely upon the Rent Restriction Act, and therefore the action was one "arising out of the Act" in the words of the subsection. There the tenant could only show title through the Rent Act, but in this case the plaintiff, claiming possession of his own property, had not to rely upon the Act. In the case under consideration the Court accepted the effect of this decision, although it expressed the opinion that a different view might be taken, but then the Court had also to consider whether by reason of a dictum in Gill *v.* Luck (1923, *Weekly Notes*, p. 284; see *The Builder*, November 30, 1923, sub-nomine Hill *v.* Luck) the matter had not been carried further, and that the subsection applied where the premises by reason of their rental value came within the Rent Restriction Acts at all. The dictum in question was that of Lord Justice Atkin, "When it is shown that the house is within the Act, proceedings to recover it must arise out of the Act," but this dictum, not having been necessary to the decision in that case, which was also distinguishable on the facts, the Court did not follow it and held that the present action was not "a claim or other proceeding arising out of the Act," although the defendant relied upon the provisions of the Act and the house was within the limits of the Act.

We may note that the words in the subsection, "any claim or other proceedings arising out of this Act," relate only to the jurisdiction given to the county court and that the operative words as to costs commence "and if a person takes proceedings *under* this Act in the High Court," and that these words appear clearly to refer to the claim and not to the defence. The jurisdiction of the county court is extended beyond the ordinary limits where the proceedings arise out of the Rent Acts, and the earlier words appear to relate to this extension of jurisdiction, whilst the latter words apply to persons taking proceedings under those Acts.

STRENGTH AND DEFENCE IN ARCHITECTURE

Sir Banister Fletcher, in his last lecture of the year, dealt with the secular architecture of the Middle Ages in France, turning from cathedrals to castles, country houses, hotels-de-ville, palaces and hospitals, which introduced a study of a different aspect of social and political life, the castles being the well-nigh impregnable fortresses of a proud and exclusive nobility. The public buildings reflected the delight shown by the citizens in erecting beautiful buildings in which their disputes should be adjudged, their municipal affairs settled, and their aged and infirm housed.

The lectures will be continued next term on January 14, and Sir Banister Fletcher will deal with English mediæval architecture, including cathedrals, churches, and domestic buildings during the term.

Devonshire House.

At a recent meeting of the Westminster City Council the Improvements Committee, reporting on the proposed Berkeley-street (Piccadilly to Lansdowne-passage) improvement, stated that they had had before them a notification from the Superintending Architect, London County Council, of an application from Messrs. Holland and Hannen and Cubitts, Ltd., for consent to the erection of a new building upon the site of Devonshire House.

The plan submitted showed a give-and-take line with piers projecting about 9 in. beyond the existing building line at the east and west ends of the proposed building on the Piccadilly front. The central portion, between the piers, was set back behind the present building line to the extent of 9 in. also. The Commitee was of opinion that the proposed bringing forward of the piers on the Piccadilly front was objectionable, and recommended that the Superintending Architect of the London County Council should be informed that the City Council disapprove of the proposed encroachments on the footway of Piccadilly as shown on the plan submitted. The recommendation was agreed to.

We have received from the publishers a copy of the *Electrical Contractors' Year Book* for 1924–5. It gives a great deal of extremely useful information, including a list of members of the various provincial branches; a short history of the Association, together with the President's Report, and a Register of Electrical Installation Contractors. At 2s. 6d. it is an exceedingly profitable investment.

MANCHESTER SOCIETY OF ARCHITECTS

THE Manchester Society of Architects recently held their annual dinner in the Midland Hotel. Through the indisposition of the President (Mr. Arthur J. Hope), the chair was occupied by Mr. F. B. Dunkerley (Vice-President).

Proposing "The City of Manchester," Mr. J. Bradshaw Gass said that the projected Reference Library and Art Gallery were still in the clouds, though he believed the Art Gallery was somewhere on the horizon. In the public interest he thought the architectural profession had not been used sufficiently. When registration was an accomplished fact, he looked forward to the time when no building plan would be accepted without being signed by a registered architect.

The Lord Mayor, responding, said the City ought to benefit by the erection of some new municipal buildings—such as the new Art Gallery, the Reference Library, the extension of the College of Technology, and of the Town Hall. The most important development of which engineers and architects in combination would take advantage was, he thought, that of ferro-concrete. Architects would have, in the future, material of great durability that was almost as susceptible to artistic treatment as stone and timber had been.

The Chairman, proposing "The Royal Institute of British Architects and the Allied Societies," referred to the foundation of the Institute in 1834, and its growth. Associated with the Institute were forty allied societies, the majority in the British Isles; but, for the rest, spread over the world. The registration of architects was just as much, he said, in the interests of the public as of the architects. The Chairman spoke strongly against the disfigurement of the countryside now going on through the erection of bungalows, wretchedly designed, fussy villas, and atrocious garages set in unsuitable places. While, as architects, they could do little to remedy this state of things, a remedy might be found in the increased interest the public were taking in their art.

Mr. J. A. Gotch, in the course of his response, said that the outlook for their Institute and the allied societies was, in his opinion, better than it had ever been, and this was largely due to the unstinted support which the allied societies had given to the parent society.

Mr. H. L. Paterson, who also responded, said he had never seen so many "subterranean" cafés as he had seen in Manchester

Dr. Percy Worthington, who proposed the toast of the guests, offered a hearty welcome to the new Dean of Manchester.

The Dean, replying, spoke of his studies in almost all the cities of North Italy, South Germany, France, Belgium, and Holland, and especially of the time spent in at least eighty great cathedrals. He had a good word to say of Manchester's old buildings, and especially of Chetham's Hospital. He looked forward with great pleasure to association with a society like that, which looked after and protected ancient monuments, and he recalled the satisfaction with which, in the diocese of Chester, he had been engaged with others in seeing that no vandal hands were laid on the old churches.

Professor Weiss (pro-Vice Chancellor of the University) mentioned the remarkable success of the department of architecture in the University under the direction of Professor Dickie. He asked architects to give their support to the effort to deal with the smoke evil. If it could not be effectively dealt with, the only alternative would seem to be to start building in black granite, which was more fit for tombstones than for city buildings, or to imitate American methods and build so high as to get above the fog and smoke screen.

A Plymouth Housing Scheme.

Messrs. Hennell & James, 19, Russell-square, London, W.C., the architects for the Welwyn Garden City Housing Scheme, tenders for which are published in this week's issue, have been appointed architects for the Lady Astor Housing Scheme at Plymouth.

THE ARCHITECTURE CLUB

ON Thursday, last week, Mr. J. C. Squire (Chairman) presided at the seventh dinner of the Architecture Club, when the company included Mr. Oswald Barron, Mr. R. M. Barrington Ward, Sir Chartres Biron, Mr. Muirhead Bone, Mr. R. S. Bowers, Mr. Darcy Braddell, Lt.-Col. H. P. Cart de Lafontaine, Mr. Ewart G. Culpin, Mr. A. J. Davis, Mr. Matthew J. Dawson, Mr. C. W. F. Dening, Mr. J. H. Elder Duncan, Mr. G. Topham Forrest, Mr. H. Austen Hall, Mr. Cecil Harmsworth, Mr. E. Vincent Harris, Mr. C. Lewis Hind, Mr. P. Morley Horder, Mr. Charles Marriott, Mr. Oswald P. Milne, Lord Newton, Sir Frank Newnes, the Hon. H. Pakington, Mr. Paul Phipps, Sir Frederick Radcliffe, Mr. H. Davis Richter, Sir Giles Gilbert Scott, Mr. Harold Stabler, Mr. Walter Tapper, Mr. Arthur Vigor, and Mr. Clough Williams-Ellis.

After the loyal toasts, the CHAIRMAN, in the course of a few words on the activities of the Club, said they felt they could see all around them the good work the Club was doing. While, of course, things would go on very much as usual if the Club had not been formed, he felt that things would not be quite the same if the Club were to come to an end. The Club had been doing as much as could be expected to promote the erection of good buildings and to prevent the disappearance of good old ones. The Committee has been considering the question of an exhibition next year, and it had been decided not to hold an exhibition in the spring, although there might be one in the autumn.

In proposing the toast of "Architecture," LORD NEWTON said architecture was not only the first of the arts, but it was also the most stable of the arts; a picture or a statue was only a fleeting possession, for it might pass to the possession of an American at any moment, but it was not an easy matter for an American to transport a complete building. He had done something to help architecture, through the Scapa Society and the Smoke Abatement Society. If it were not for the Scapa Society, they might find the dome of St. Paul's covered with advertisements. The public were extraordinarily indifferent to the question of smoke abatement. If we had a pure atmosphere, the cost of the upkeep of national monuments would be reduced by one-half. Buildings like Somerset House, Chelsea Hospital, and Buckingham Palace had deposits of soot half-an-inch thick under the cornices which could not be broken with a hammer. Westminster Abbey was decaying, not from age, but from corrosion caused by smoke. A whole army of men was employed in preventing the ornaments of that building from falling down; one could go over the building and pull off with the hand any of the more delicate ornaments which adorned it. The same thing would be found in all industrial towns. St. George's Hall, at Liverpool, one of the finest buildings in this country, was coal black.

In responding, SIR GILES GILBERT SCOTT said he owed a great deal to the Club, which had done much to promote public interest in architecture. One of the great difficulties of the architect compared with those who practised the other arts was that the architect had to deal with so many interests and so many people; most of the other arts were confined solely to the artist himself and the medium through which he worked, whereas the architect was up against the public, the client, the building committees, and various other interests. It was extraordinarily difficult to reconcile every interest, practical and æsthetic, and to satisfy the wishes and requirements of all the people concerned in a new building. He had been exceptionally fortunate in this matter at Liverpool, where the Chairman of the Cathedral Building Committee, Sir Frederick Radcliffe, had been so very sympathetic and helpful that it had undoubtedly made a great difference to the building itself.

"The Club" was proposed by Mr. NORMAN WILKINSON, who said he could not help being afraid that in the future the present Regent-street, with its uniformity of building, would be pointed to as the architecture of this age. Refe street posters, he said the modern street as apart from the railway posters, was work of the artist, but of the manuf The average manufacturer too often t attitude that he knew what he want intended to have it, without realising th he wanted was not always what the publi A great many fine buildings were entirel by posters, whereas it would, in fact, o possible to improve a building by good tastefully displayed.

MR. CHARLES MARRIOTT briefly respon

ROYAL INSTITUTE BRITISH ARCHITECT

WE take the following notes from the n of the Council meeting held on December

Architecture and Craftsmanship.—O recommendation of the Art Standing Com it was decided to arrange an evening during the session of 1925–1926, on the s of "The Co-operation of the Architec Craftsman," and to arrange a series of p afternoon lectures in the spring of 19 various crafts.

Buildings threatened with demolition.— recommendation of the Art Standing Com it was decided to take steps to ensu collection and preservation of photogra buildings of architectural merit in L which are likely to be demolished, and to the Allied Societies to take similar st their respective provinces.

The Tribunal of Appeal under the Building Acts.—Sir Banister Fletcher appointed as the architect-member o Tribunal of Appeal in the place of the la John Slater.

The University of London Architectural cation Committee.—The late Mr. Paul Wate and Mr. Maurice E. Webb were nomina representatives of the R.I.B.A. on this mittee for the year 1925–1926.

The Royal Sanitary Institute Congress, 1 Mr. J. Inch Morrison was appointed delegate of the R.I.B.A. at the Congress held in Edinburgh in July, 1925.

Examinations Fees.—On the recommen of the Board of Architectural Educati was decided that students of recognised s exempted from the Final Examination attain to candidature for the Associateshi who pay examination fees in their sc shall in future pay fees to the R.I.B.A. to £10 10s. instead of £15 15s.

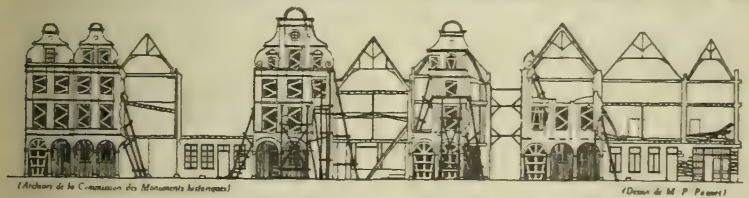
Nominations for Membership.—Three didates for the Fellowship and nine cand for the Associateship were nominate election on January 5, 1925.

"The Timber Trades Directory."

The proprietors of the *Timber Trades Jo* Messrs. William Rider & Son, Ltd., 8, B noster-row, London, E.C. 4, have just pub the ninth edition of their "Timber T Directory," containing classified lists of in the United Kingdom engaged in the fo Colonial, and home timber trades—softw mahogany and hardwoods, plywood, vene and in the saw mill, packing case and trades, together with lists of the leading in the principal wood-consuming indus of exporters of wood in the various producing countries, also of Colonial imp and merchants, &c. Information has bee tained from every quarter of the globe, a view to bringing the Directory as far as sible up to date. The book, of over 900 p also contains some sixteen plans of the cipal docks in the United Kingdom. published at 15s. net; by post, 15s. 9d.

TOWN PLANNING IN FRANCE

EUT.-COL. H. P. CART DE LAFONTAINE ntly read a paper on "Town Planning Development in the Reconstruction of the stated Areas" before the Northern Poly- nic Institute. In the course of his re- ks, the lecturer said the first work to be rtaken was, of course, the gigantic task earing the chaotic debris of war from the lefields, the restoration of the cultivated s to their owners, and the provision of porary shelters for those of the inhabit- who wished to return to their wrecked shattered homes. This was a task of edible difficulty because over the greater of the area no roads existed, the rail- s had been torn up, and the ground was red with miles of barbed wire, live shells, es and trenches. Just to illustrate this, them take the state of affairs in the De- ment of the Somme; here (at the date of Armistice) there were 500,000 acres of nd which had been churned up by shell 205 villages (or 39,497 houses) in ruins, a further 176 villages (or 24,976 houses) ly damaged and more or less uninhabit- e.



n the spring of 1919 two Acts were passed ch had an important bearing on all subsequent work of reconstruction. first, passed on March 14, 1919, in effect a Housing and Town- ning Act, and the second, of April 17 the same year, dealt with the settle- t of claims for war damage com- ation. Various amending Acts had since passed, of which the most important was of July 19, 1924.

LAY-OUT PLAN OF TERGNIER, 1923.

(Archives de la Commission des Monuments historiques) (Dessin de M. P. Paquet)

ARRAS—METHOD OF SHORING UP BUILDINGS IN THE PETITE PLACE IN 1918.

ther step in the work of reconstruction one that naturally followed from the ts which resulted from association was the formation of co-operative (building) societies composed of all the "Sinistrés" in a particular region, village, or town. A special Act was passed in 1920 regulating the status of these societies, and it was provided that those who became members of such a Society could not withdraw until the work which was the common aim had been completed. This was an important step forward, and gave the necessary permanence to these groups, which enabled the State to grant subsidies for working expenses, etc. It also enabled the larger towns to raise the money required for reconstruction by local loans on the security of the total compensation due to citizens for war damages, etc. A panel of architects was formed for each department, and one or more were definitely associated with each "co-operative"; the actual work of re-building was generally entrusted to one contractor, or (in the case of large towns), to a group of contractors.

In this way the work of reconstruction was at last put on a solid basis, and proceeded rapidly up to the beginning of last year.

Special co-operatives were formed for such purpose as the rebuilding of churches, etc., and special loans were successfully floated at 6 per cent. interest to provide the necessary funds. Then a serious check occurred, as the funds for the payment of the war damages were practically exhausted, and, for a time, all payments by the State had to be cut down or, in some cases, ceased altogether. Work came to a standstill, and many cases of particular hardship to contractors occurred. In fact, one of the greatest difficulties which had to be overcome had always been the problem of how to meet the situation, due to the partial default of Germany in the matter of re-

1915.

1923.

THE PETITE PLACE, ARRAS.

paration payments, and it is really remarkable that, notwithstanding this, the work of reconstruction was to-day practically completed.

The work of reconstructing buildings of artistic and historical interest was undertaken directly by the State. How this was done could not now be described, but the views of the reconstruction at Arras will indicate the nature of the problem and show the results attained. This work at Arras cost just over four million francs.

In the first period, after the preliminary work of clearing away debris had been pretty well completed, there was a tremendous demand for masons, bricklayers, carpenters, and, in fact, any men with some knowledge of the various branches of the building trades. Various expedients were adopted, and dilution was practised on a scale which would have shocked our trades union friends over here. Thousands of Poles, Belgians, Italians, Spaniards, and even Arabs and Chinese were employed by the contractors working for various "co-operatives." These men were

CAMBRAI: VIEWS OF THE CENTRE OF THE TOWN IN 1919.

attracted by the big wages—when reckoned in the depreciated currencies of their native countries—paid as they were, of course, in francs, at French trade union rates. At this time several schemes were worked out for the employment of British labour in France, as there was no doubt this solution would have been welcomed by the population. But the difficulty of the difference between British trade union rates and the French rates, aggravated by the depreciated value of the franc, as compared with sterling, proved an insurmountable obstacle.

A factor which impeded the work of reconstruction was the introduction of the eight hours' day in 1919. Although legally established, the lecturer did not think this was ever observed in the devastated areas, but the question naturally led to difficulties, and in the early part of this year an amending Act was passed dealing more particularly with the building trades. The general effect of this Act was, that although the eight hours' day as established by the previous Act, must be observed, yet in cases where both employers and operatives were agreed, time lost either in stoppages from any cause or because of wet or inclement weather could be made up.

"La Renaissance des Cités," a French society, founded in 1916 by M. Mitrécy and Mlle. Tarrade-Page, had amply justified the intentions of the founders in helping local authorities with free advice on all matters connected with reconstruction. It included among its members many distinguished architects, doctors, legal authorities and engineers, all of whom for many years had devoted their time and abilities to this work in an entirely honorary capacity. It at first had to rely entirely on voluntary subscriptions, but at a later date the Society was recognised by the French Government and received a small annual grant towards working expenses. It had done much to promote the idea of town planning on Garden City lines, not only among the population but also among the captains of industry and the railway companies, etc. Much assistance and encouragement was also given to the inhabitants of the devastated area under the various schemes of "adoption" of towns and villages, and particularly with regard to the work of the "British League of Help," which had promoted direct and cordial relations between many towns in Great Britain and in the devastated areas of France. The reconstruction of the devastated areas presented an opportunity such as rarely occurred for improving the conditions under which the inhabitants lived in pre-war days. If this opportunity had not been fully made use of—and such was indeed the case—it must be admitted that this was due to the dislike of innovations and the extraordinary attachment to his own particular piece of land, which was so strong a characteristic of the peasant.

THE "STADE" AT LENS, SHOWING COTTAGES BUILT BY THE NORTHERN RAILWAY (

However, much (as they would see the lantern slides) had been done; a lead had been given by the Northern R Company of France. This building gramme was commenced in 1920, and lay-out of the new housing schemes proc on Garden City lines mainly because th

ployees had the right to a garden of be 400 and 500 sq. metres (500 to 600 sq. or an average of approximately eight to the acre. The accommodation pr naturally varied, but the typical plan pr a living room, kitchen, a cellar or store a small hall and three bedrooms of fai A certain proportion of the houses in scheme had five or six rooms, to me needs of employees with large families. of the most successful, as it was the l of these schemes, was that designed Bertrand for the important junctio Tergnier in the Department of the Aisn others included Lens (Louis Sue, arch Longeau, St. Quentin. Montdidier, ciennes, etc. Local materials were ma of wherever possible, and most of the shown in these views had hollow wa pre-cast concrete blocks, and were roofe tiles of what was known as the "Marse type.

In his concluding remarks the lectu ferred to the assistance which he had given by Monsieur Morain (late Pre the Department of the Somme), the late sieur Naudin (Prefect of the Departm the Nord), and many local authorities and by the Société Centrale des Archi who had kindly allowed him to reproduce trations which had appeared in their jo *L'Architecture*.

GIRLS' SCHOOL AT LENS, 1923.

A DIALOGUE ON HOUSE-BUILDING

By G. H. BLAGROVE.

E young architect known as "Y" salutes the old architect.

: I'm sorry to bother you, but I'm in le.

: I'll pull you out if I can.

: I've got a troublesome client.

: That's no unusual experience. Better no client at all. You must humour him.

: But my client is a woman.

: The study of woman's ways is an essential of our profession.

: She's on the labour-saving stunt.

: You may pick up some hints from her.

: She gives more commands than hints. wants a house designed on what she calls mmon-sense principles."

: In what style of architecture?

: None. Plain walls and openings, without ost of ornament—not even so much as a lding. I shall make the walls concrete and h-cast the surface; I shall put in two ses of slanting red tiles to break joint in ent as window sills.

: Try to keep a fixed ratio in the width and ght of your openings, say five to nine through- and you are sure of a certain quiet dignity.

: I think if I cut the windows up into ll squares it will make them look larger.

: It would, but think of the labour cleaning all those panes—wiping out dy smears from the corners. Twenty years I saw some West End mansions with small dows—casements with leaded glass in int shapes. The owner invited tenders n several firms for window-cleaning by the r, and the lowest was £62!

: I'll have sheet glass in large panes. The says the windows must be cleanable from ors.

: Casements opening inwards or some tal arrangement.

: She says there must be no mouldings where, because they harbour dust and make k.

: Here is a sketch for a low bar. I presume there t be no sunk panels in the rs?

: None. Panels to the full kness and bead-flush.

: Bead-flush would look er than a plain face. You must eschew ldings altogether and rely for effect upon beauty of the surface. In the best rooms the figured grain of polished hardwood, and ferior rooms have deal painted in two tints; and patterns on a ground; light on dark ark on light, whichever suits the character he room.

: I am told that I must have no plaster ices or centre flowers, because they harbour

: A new era is dawning. We must rely e and more upon flat colour decoration. ed, it is often difficult to combine the actions of colour and form; one mars the t of the other at times. Plaster surfaces absorbent and not washable. For ceilings well as walls I am in favour of varnished ers; and when we can afford something er than ready-made patterns, why not d-painted decoration?

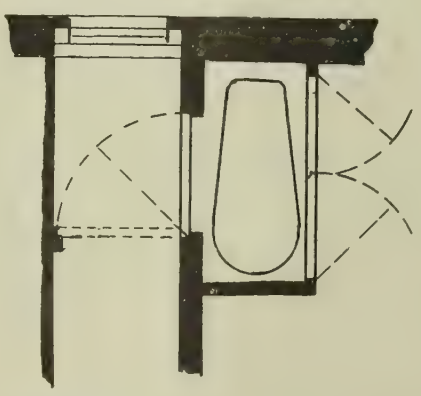
: I am undecided about the position of the s in this house, which is one in a terrace. client complains that space is often wasted bbies and passages by architects who, she do not understand their business.

: If you are satisfied to have a small room ont you can have a large entrance hall with ont staircase. Then the back room can nd to the full width of the house, if you do nind crossing the room to get to the premises e rear. Another way is to run the staircase s the middle of the house, parallel with the ; but in that case it is difficult to light and ilate the stairs.

: Then she says the stairs must be so rived as to minimise sweeping and dusting.

O: An open string staircase is best for that. Oh, I have noticed how dirt nestles in the angles between tread, riser, and close string! No brush or broom will reach it; it has to be raked out with a knife or skewer. I dipped into Byron lately and I am moved to misquote:

"Know ye the land where the impress of dirt'll
Cling close in the nooks of the stairs that you climb?
Where, on touching the handrail, the cuff of your shirt'll
First act as a duster, then glisten with grime?"



Y: But I must have a close-string staircase because my client objects to the labour of wiping down balusters. She wants the space between the handrail and the outer string filled in with solid panels. I am not going in for expensive circular work, so I must have newels.

O: Another opportunity for beautiful or beautified woodwork. There can be no turned work in the newels, except to the tops and pendants. Even there you must avoid mouldings as far as possible. The simplest forms are the best, and it does not matter how large is the sweep of a curved profile, provided that it is accompanied with narrow fillets or beads to give it scale. Here is a sketch of a turned top and pendant to a square newel. You know my partiality for urn-shaped ornaments. The handrail must have no hollows in it. A plain circular section is best.

Y: There are other questions. My client complains that in her present house the bath is fixed against the wall so that it cannot be cleaned properly. She wants a space between the bath and the wall. Of course I sympathise, but I don't see how to fit it in.

O: Here is a plan showing what you can do when you are pinched for room. The bath recess obtrudes into a bedroom with doors to

the enclosure, so that it can be used from that side. When these doors are closed, the door from the other side can be opened back across the corridor into a frame, forming a temporary bathroom. You see there is access to both sides for cleaning purposes.

Y: Another thing that my client is dead nuts on are fixed wall cupboards, instead of movable furniture, which, she says, accumulate dust.

O: Cupboard fronts to recesses ought to cost less than complete wardrobes. I would run the cupboard front to the ceiling, to avoid a dust-harbouring top. A small upper compartment is useful for articles only occasionally in request. By the by, has it occurred to you that a lady's wardrobe ought to contain compartments for hats?

Y: By jove! I don't visualise the dimensions of women's hats, although I know something of the cost.

O: Without forecasting the decrees of Dame Fashion, I should say a cube of eighteen inches. There ought to be a series of them, one above another, which might be all closed with one glazed door. Dust would not settle upon boots and shoes if they were confined in a long, low cupboard, about a foot high and wide. This might be at the bottom of a wardrobe.

Y: This lady complains of the labour involved in carrying water to bedrooms.

O: Every bedroom should have a fixed lavatory basin with hot and cold water supply and waste. How do you arrange bedsteads?

Y: Oh, in the usual way—head against the wall, if possible; if not, one side goes against the wall.

O: Too often we architects have been tempted to the latter plan. But we ought to consider that every time the bed is made the bedstead has to be dragged out and pushed back again. There should be an eighteen-inch space between the bed and the wall.

Y: We cannot always afford that.

O: Sometimes ingenuity is misdirected in trying to squeeze too much into a plan. When the side of a bed is against a partition it is sometimes possible to form a wide opening closed with folding doors in the adjoining room. This would give free access to both sides of the bed.

Y: As regards heating, this lady does not see why one fireplace should not warm two rooms.

O: I have seen a central fireplace warm six rooms by means of pipes and radiators. I can imagine a fireplace sending heat into an adjoining room, if the back were thin enough. Perhaps a firebrick slab would serve the purpose. It could be tiled on the opposite side.

Y: I propose to provide alternatively for coal or gas heating.

O: Where coal is stored let there be at least one step down into the cellar, to prevent coal dust drifting out under the door. Get in a window if possible, to save artificial light.

Y: The sink is to be in the kitchen, to save walking to and from the scullery, and the dresser, closed in front with glazed doors to exclude dust, is to be near it.

O: If the dining-room adjoins the kitchen, put the dresser into an opening in the partition between. It should be double-fronted, with doors opening both to the kitchen and the dining-room. China, when cleaned, is put in from the kitchen side and taken out from the dining-room side. Provide a plate-rack with a movable zinc tray under it to catch water dripping from the plates.

Y: My client wants the larder approached directly from the kitchen to save "journeys"; but it would get the hot air.

O: Form a ventilated lobby between the kitchen and larder and have an extra small larder for milk so that it shall not be exposed to the odours of fish, game, and sour-smelling salads. There need be no waste of space, because any inodorous foods can be kept in the milk larder.

Y: Then there is to be some arrangement for laundry work. I shall provide a copper of improved type.

O: Don't forget to feed it by a tap so that water need not be carried to it.

Y: Talking of a tap, my client thinks there is economy in using rubber washers.

O: A mistake. I know a case where a rubber washer was put in, and one day the rubber split and the water rushed out. Nothing could stop it until it was turned off at the main.

"Blurting and spurting,
And every way squirting;
In whirlpools reverting
From sink unto skirting—
That's how the water went over the floor."

Y: Poor Longfellow!

O: Rubber washers are suitable for bath waste plugs, but you must have composition or leather where there is pressure.

Y: I propose to provide a hot-closet for airing linen.

O: I wonder we have not adopted the plan commonly followed in Scotland. In front of

the kitchen fireplace is a long wooden bar suspended from the ceiling with cords and pulleys at each end. It can be adjusted to any convenient height for airing sheets.

Y : Kitchen fittings are among the most important. I am just considering where saucepans can be stored.

O : I know the usual pot-board under the dresser, which is deep enough to contain two rows of saucepans. The utensils wanted for use are frequently to be found, like extra ladies of the ballet, in the back row. Deep shelves and cupboards are only suitable for stores that are not wanted in a hurry. I would have a recessed cupboard for single rows of pots upon shelves, closed in front with doors, to keep out dust. Dish covers and other articles hung upon walls would collect dust; therefore they should be in enclosed cupboards. It comes to this, that most of the available wall space in the kitchen and offices should be occupied by shallow cupboards closed with doors.

Y : What about the roof? I suppose a hipped one with projecting eaves and cast-iron gutters would be cheapest.

O : Yes, and to my mind preferable in appearance. But if dead leaves or other obstructions block the gutter and cause rain-water to overflow it would need a labourer to clear it out from a ladder, which he might have to shift from place to place. If you have a parapet and a trap-door or dormer in your roof, you can cleanse your own gutter when you please.

Y : What is your opinion of chimneys?

O : That they should find no place in house construction. Let all heating be by gas or electricity or both. But if people will have the "cheerful open firegrate," let us guard against down-draughts of smoke. Now if you take a walk in Suburbia, or indeed, anywhere, you must be impressed by the clusters of tallboys that crowd the upper air. Are not these standing proofs that our chimneys have not been built high enough to cause sufficient velocity in the up-current?

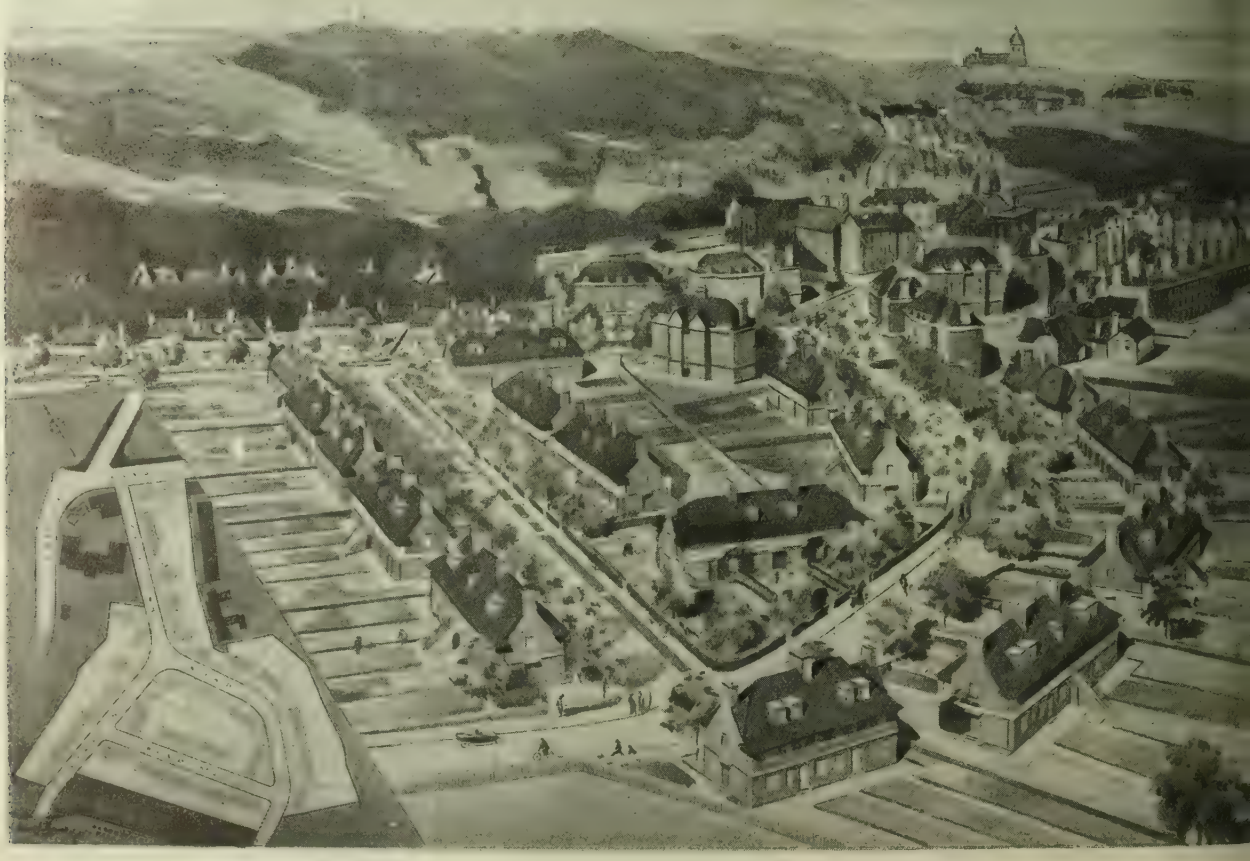
Y : What height would you recommend?

O : Twenty-five feet from the fireplace opening to the chimney cap would give a velocity equal to that of a boisterous equinoctial wind. You do not get that height for a top story.

Y : I have picked up some useful hints from you, and should like to know where to find a few more.

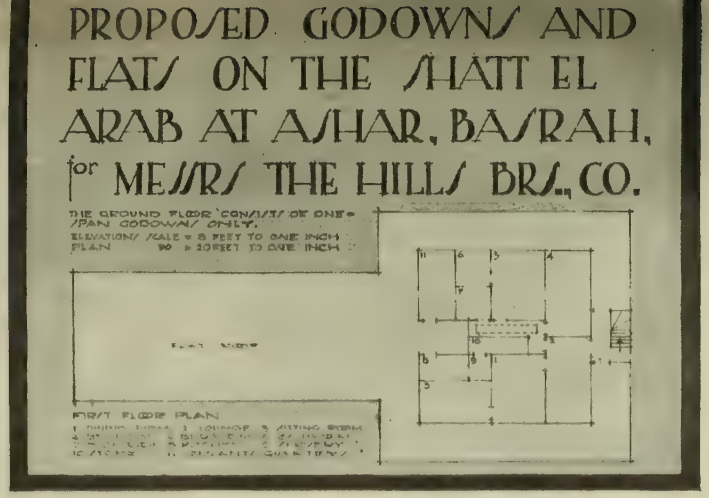
O : I'll tell you. I have jotted down our conversation in shorthand, and I will ask the Editor of *The Builder* to publish a report of it and invite correspondence.

BROOKFIELD HOUSING SCHEME



THE housing scheme at Brookfield, Highgate, N.W., for the St. Pancras Borough Council, gives accommodation for 102 families and occupies an area, including roads, of 10¼ acres. It is on sloping ground, having a difference in level of 29 ft., from south to north, is situated within three minutes of Parliament Hill Fields, and has the wooded heights of Highgate and Hampstead as a background. The lay-out was governed by a winding road through allotments. A second through road has been formed from near the upper end of Croftdown-road to St. Albans-road, with a subsidiary cross-road at the south end. The upper part of the estate is laid out for flats, four stories in height, in blocks of eight and sixteen, of three and four rooms, besides cooking sculleries, bathrooms, &c.; and the lower portion with maiso in blocks of four and five and of four rooms each, besides cooking scullery room, &c., finishing with a pair of s cottages. An allotment is planned f flat in the rear of the buildings, and each nette has its own front and back garde direct access. The front boundary an fences are formed of oak posts and wire planted with privet. The blocks of build set out on centre lines with clear vistas each block, or terminated at the end of r a building.

All buildings are wired for electric lig gas installed for domestic hot-water and cooking purposes, the living-room fitted as sitting-rooms, with tiled regist grates.



The facings of the flats are red-bricl blue-brick plinths and artificial Portlan dressings and main moulded cornice an covered with hand-made sand-faced roc The maisonnettes are roofed with simila and faced with red bricks and brown the upper part of each intermediate bloc rough-cast, the eaves being formed wi soffits. The windows of the flats are box and frames and wooden casements f maisonnettes, and all floors of steel and c covered with wood or mastic.

The scheme provides accommodatio twenty tenancies to the acre, and at th time gives large gardens and ample ope about and around the buildings, this possible by adopting as a principle th bined use of flats and maisonnettes, thu actual building-site area on land too co the usual lay-out of groups of houses.

THE WEEK IN PARLIAMENT

WESTMINSTER, *Wednesday.*

Alleged House "Profiteering."

Baker asked the Minister of Health
r he was aware of the profiteering which
ied in respect of housing accommodation,
lly in London; and whether he would
r the possibility of appointing fair rent
to which all cases of unfair rents might
mitted?

N. Chamberlain said that no cases had
y been brought to his notice. Certain
ons of the Rent Restriction Acts could
oked in this connection. The establish-
of rent courts would not be an effective
ute for such Acts at present.

Closing Orders.

N. Chamberlain informed Mr. H. Williams
cording to the reports of Medical Officers
22–23, representations were made during
ar with a view to Closing Orders in respect
55 houses. Closing Orders were made in
t of 2,331 houses, and in 640 cases Closing
were determined after works of repair
een carried out. In the same period
were secured in the case of 542,834 houses
sult of the intervention of local authorities.

A Site at Bedlam.

Day asked the Minister whether he was
that the Bedlam Institution of Southwark
be vacated at an early date; and
er he was prepared to use this site of
res, now occupied by the institution, for
ovision of 100 working-class houses on
city lines?

N. Chamberlain said that the acquisition
te for housing was primarily a matter for
al authority concerned. He understood
roposals for the use of the site, if it could
uired, for housing or other public purposes
nder consideration by the London County
il.

Special Training Schools.

Forrest asked the Minister whether his
on had been called to the experiment in
lia where the unskilled unemployed had
aken off the streets this year and, after
months' training in technical schools,
ssed a test of laying over 1,000 bricks
aight work in an eight-hour day;
r he was aware that this year classes
sterers had been started, and could he
h what success; and whether he would
r adopting similar methods in this
y?

. Wood said he was aware of the experi-
Schemes of special training were being
red in connection with the arrangements
by the building industry for increasing
pply of skilled labour in the industry.

Pre-War Rents.

Stephen asked the Minister if he proposed
oduce legislation for the reduction of
pre-war houses, and to prevent property
obtaining rent for houses which had
ondemned by the sanitary authorities
t for human habitation?

. Wood said that the Minister did not
to introduce fresh legislation for the
s mentioned. The efforts of the Govern-
ould be directed towards reconditioning
ble houses and expediting the erection
houses to take the place of those that
eyond repair.

Preference for Britishers.

ain Waterhouse asked the Minister if he
consider the advisability of making it
ition, when making grants to local
ties under the Housing Acts, that pre-
should be given to applications of
citizens, and that in cases of equal
preference should be given to the
tion of ex-service men?

N. Chamberlain said he presumed the
id gallant member referred to houses
by local authorities for letting. He did not think it was desirable, nor did he think local authorities would wish him to restrict further their discretionary powers in regard to the control and management of houses erected under the Housing Acts. He had confidence that local authorities generally gave full consideration to the claims of all applicants for a tenancy of their houses, and he believed it was the general practice to give weight to the two grounds of preference to which the hon. Member alluded.

Self-Contained Flats.

Captain Garro-Jones asked the Minister if he would give an undertaking that the Government would, in the preparation of its housing scheme, offer assistance and encouragement to builders of blocks of hygienic self-contained flats of a low rental value, and thus meet the needs of a district like Hackney, where the only available spaces for building were those to be obtained by the clearance of slums?

Sir K. Wood said assistance was available, both by way of loan and subsidy, under the existing Acts of 1923 and 1924, for the building of self-contained flats, and the Minister would be glad to consider any such proposals submitted to him by local authorities, whether as part of schemes for the clearance of insanitary areas or otherwise. Blocks of flats had already been erected, or were proposed to be erected, with Government assistance, in London and elsewhere.

Smoke Abatement.

Sir K. Wood informed Sir H. Brittain that the Government contemplated the introduction of a Smoke Abatement Bill as soon as convenient opportunity arose, but he could not promise that the Bill would be introduced before 1926.

Lodgers.

Sir K. Wood informed Sir W. de Frece, that the conditions under which the taking of lodgers might be permitted in houses provided under the Housing Acts by local authorities were within the discretion of the local authorities themselves, and it was not proposed to interfere with that discretion.

Houses Inspected.

Sir K. Wood informed Mr. Forrest that in the last year for which statistics were available the Reports of Medical Officers of Health showed that 1,115,394 houses were inspected, and repairs secured in 542,834 cases as a result of the intervention of the local authorities.

Overcrowding in London.

Mr. Thurtle asked the Minister if he would call a conference of the overcrowded boroughs of London with a view to urging upon them the necessity of taking early and full advantage of the Housing Acts in order to relieve the overcrowding existing in their districts?

Sir K. Wood, the Parliamentary Secretary to the Ministry, said it was doubtful whether any useful purpose would be served at the present time by calling such a conference. The Metropolitan Borough Councils were fully aware of the facilities provided by the Housing Acts, and the Minister understood their representatives are attending a Conference to-morrow (December 17) to consider matters connected with them. The London County Council had made considerable provision in various districts for the erection of houses to meet overcrowding needs in London, and had recently framed a programme for the erection of 20,000 further houses.

Steel Houses.

Mr. Arthur Greenwood asked whether the Minister of Health intended to limit the grant to be given to new methods of construction to the Weir type of house only?

Sir K. Wood, Parliamentary Secretary to the Ministry, replied that the Ministry had drawn attention to the Weir type because Lord Weir's experiment was probably more advanced than any other. If the Committee presided over by Sir E. Moir made recommendations as favourable the Minister would not seek to put one scheme before another.

Parliament adjourned on December 19 to February 10.

ARCHITECTS' & BUILDERS' INQUIRY BUREAU

We are glad to give questions and answers, but cannot accept responsibility for contributed replies, especially to legal matters.

May we appeal to our correspondents to submit their queries on paper of a size easily filed, and written as legibly as possible, or better still, in typescript.—ED.

Building Lights.

[REPLY TO "S. T. C.," DECEMBER 19.]

SIR,—Everyone who owns a building has the natural right of light coming to that building, either over his own land or that of another, and, for the purpose of enjoying that light, may place his building where he pleases, provided he complies with by-laws, and any restrictive covenants there may be in force. Further, he may open up windows anywhere he wishes in the building.

Now, it would appear that B, the owner of the window, has acquired an easement of light, he having enjoyed the right for the prescribed period of 20 years. S. T. C. is therefore obliged to refrain from building on his land in such a way as to hinder the light from entering B's window and causing an actionable nuisance. But this does not of itself preclude S. T. C. from building the building at A, or continuing it as shown by dotted lines in his sketch. The answer to all his questions is, therefore, No.

What S. T. C. must consider is the test that has to be applied in all these cases. It is not a certain test; on the contrary, it is very elastic, and no rules can be laid down for his guidance; but he must consider whether the obstruction is such an infringement of the easement of light, that the deprivation of light is substantial in amount and enough to render the occupation of B's premises uncomfortable; and, if they are business premises, whether it prevents the owner carrying on his business as beneficially as before the obstruction was made.

An easement of light does not give to the owner thereof a continuance of the light he has always enjoyed, and the question of what light is left does not need to be considered. It is the difference between the light received before and the light received after building an obstruction that must be taken into account in considering the diminution of light. See Colls *v.* Home and Colonial Stores, Ltd. (1904, A.C. 179); Davis *v.* Marrable (1913, 2 Ch. 421); and Paul *v.* Robson (1914, 83 L.J. (P.C.) 304), when test was held to be whether obstruction complained of was a nuisance. Also see Semon & Co. *v.* Bradford Corporation (1922 2 Ch. 737), which dealt with the application of quantitative tests.

"LEGAL."

Speculative Building.

[REPLY TO "BUILDER," DECEMBER 12.]

SIR,—I do not think good, honest building of the simplest villa character can be executed in the London area under a cost of 1s. to 1s. 1d. per foot cube. In some of the Midland and Northern districts this may, perhaps, be reduced to 11d., but there will be little enough profit for the builder in either case. Prior to the rise in prices that has occurred in the past year, I have heard of such work being carried out for 9d. per ft.

"CUBE."

SIR,—The current selling price of terrace-type houses in the North Midlands to-day is 9·75d. per ft. cube. Subsidy would be deducted to obtain net price.

"TEXAS."

Ranges.

SIR,—Can any of your readers inform me if there is a type of range on the market which will perform the usual duties and at the same time provide a fire for another room immediately behind? I have a vague idea that I have read or heard of such a type, but cannot get any particulars.

"ECONOMY."

THE BUILDING TRADE

ROAD ENGINEERING*

THE science of road construction has entirely changed in the last ten years and many who were quite *au fait* with the construction of flint or granite macadam roads in the old days find that they have to learn afresh the science of road construction, from the first principles onwards. The coming of the motor-car, and especially of the heavily-laden motor lorry, has entirely revolutionised road construction, not only in this country, but in all parts of the world. Road surfaces are entirely different and even road foundations are altering in character.

Mr. Leeming's book is an attempt to give in a concise form the technical side of road construction in the light of the new conditions created by modern traffic. There has been a tendency in the past to treat the subject of the road independently of the vehicles using the road, and it is on this dual aspect of the subject that the author touches.

The advent of the new motor licence duties in 1921 marked the beginning of a new era in road development, more especially as these duties place a much larger sum of money at the disposal of the road authorities for improvement and road maintenance than ever before. The principle is now well established that the traffic using the road should bear at any rate the major part of the cost.

As the author well says, "It is to be hoped that, in the near future, there will be a much more rapid development in the use of pneumatic tyres for commercial vehicles, omnibuses and char-à-bancs, with a much lighter taxation than for the solid rubber tyred vehicle, and there is some ground for thinking that ultimately the taxation authorities will offer encouragement in this direction with a view to reducing the damage to roads."

A large amount of research work is being carried out both in America and in this country on the subject of wear and tear of roads by various vehicles and varying loads, and there can be little doubt that both the scientific and mathematical sides of the subject will require more and more attention with the growing importance of our road system. The æsthetic side of the road, both as something in itself pleasing to the eye and as an ever changing vantage point from which to see the surrounding country, is always in danger of being forgotten.

The first essential of a good road is a dry subsoil, with efficient drainage. The question of the placing of road gullies and a proper amount of camber therefore must come into consideration at an early stage. In these days of hard impervious surfaces, much less camber is required than in the days of the old turnpike road, and the author gives as a desirable average crossfall from 1 in 36 to 1 in 48. With concrete paving this can be reduced still further.

The distance apart of the gullies will depend upon gradients, crossfall and width, as well as on the road surface, but not every engineer will agree with the suggested spacing of gullies at so close an interval as 20 yards.

There is an interesting chapter on bridges, culverts, and retaining walls. The Ministry of Transport have issued details of the maximum standard loading for road bridges. This includes provision on each 10 ft. width of the bridge for a train of heavy vehicles consisting of an engine of 20 tons weight drawing three trailers of 13 tons each. An allowance of 50 per cent. for impact increases these weights to 30 tons for the engine and 20 tons for each of the three trailers. Needless to say, many road bridges all over the country are insufficient to carry such a load and will need ere long to be entirely reconstructed. The unit of 10 ft. of width for each line of moving traffic is now generally adopted, so that road widths, as well as bridges, now very largely follow this rule, the older standard of 8 ft. for each line of traffic being gradually discarded.

On railways it has always been the practice on curves to provide for super-elevation of the outer rail, and with the increasing speeds now common on our roads it is becoming equally necessary to raise the outer edge of all road curves and to increase the road width at bends, especially as the great length of the motor lorry demands greater width in turning and quick bends are becoming increasingly difficult to negotiate.

Mr. Leeming gives elaborate rules for determining the amount of super-elevation on highway curves, but with varying speeds, weights and surfaces the problem is not by any means so simple as fixing the amount of super-elevation for a railway curve.

Even in the concrete roads of the United States the practice varies widely in the different States, but the general recommendation is that in road curves of 150 ft. radius or less a maximum super-elevation should be given of $\frac{3}{4}$ in. per ft. of width, or $\frac{1}{2}$ in. per foot of width in curves up to 500 ft. in radius. In town areas such a recommendation is hardly practicable, but there can be no question as to its necessity in bends on country roads.

The valuable census of traffic on Class A and B roads which has been undertaken by the Ministry of Transport during the past two years has already proved its usefulness in many directions, and it is certain that every real improvement in our road system must be based on accurate knowledge of the statistics and distribution of the present traffic. Not only does the road traffic in most cases vary from month to month, but large fluctuations occur from hour to hour, and it may frequently happen that a road which is crowded to excess at certain hours is almost empty at other hours.

New arterial roads and by-pass roads are being designed in all directions, and an essential preliminary to these proposals is that reliable information shall be available as to the amount of traffic and the direction or directions which that traffic wants to take.

The question of road widths is becoming more and more important. Not only is sufficient space wanted for two, four or six lines of fast-moving traffic, but there must also be ample sighting space on each side clear of trees or other obstructions, hence a total width between fences is required approximately double that of the roadway itself. A road 120 ft. wide between the fences is therefore none too much for modern traffic conditions, and with our knowledge of what the growth of traffic has been even in the last few years it is in every way unwise to hamper and limit the future development of large and growing communities by a cast-iron adherence to by-law widths or by-law standards of construction. Everything points to even wider roads in the near future, especially in the neighbourhood of our large towns.

Paving by grit setts and granite setts, creosoted wood blocks, and other materials is dealt with in detail. Brick paving has been much used in America but is, fortunately perhaps, hardly known in this country, and in any case it is hardly a suitable material for heavy traffic.

A couple of pages are given to tramways. To the motorist there is nothing more maddening and to the would-be-rapid traveller there is nothing more restraining. There is a place for the tramway, but it is not in the street.

Water-bound macadam, as the author says, is not a form of road-making which belongs to the present age of motor transport. Periodical application of tar and chippings may help, but it cannot alter the permanent character of the road. In some countries roads have been re-surfaced with silicate of soda and other materials. Surface tarring is undoubtedly advantageous, but it should never be carried out unless the road is thoroughly dry.

Bituminous road surfaces are of many types—the term bitumen, as distinct from tar, has been defined by the British Engineering Standards Committee as covering only materials essentially resilient in character, soluble in carbon-disulphide (CS_2) and obtained only from distillations of earth oils or ground asphalte. Pit macadam, sheet asphalte and bitum crete, and reinforced concrete roads a with in detail in the book, which is es a practical character.

Road corrugation—the bugbear o engineer—comes in for special treat details are given of the pneumati breakers which are so noisy an acco to modern street repair operations.

* "Road Engineering." By E. L. Leeming, M.Sc., Assoc.M.Inst.C.E. (Constable & Co., Ltd.) 18s. net.

THE RATING OF SP PROPERTIES.

MR. DALGLIESH, in a recent lecture Rating of Special Properties and U dertakings" at the College of Estate ment, pointed out that the same st applied to the valuation for rating of a £35 a year villa as to the giga mercial and public utility concerns such as the tramway system of the County Council or the Great Western system. In each case exactly the sa tion had to be asked and answered, was the rent at which this proper reasonably be expected to let from year?" Certain principles which mon to the valuation of all propert then reviewed. There must be ben cupation, *i.e.*, it must be reaso assume that a tenant would pay a re property greater than the probable annual cost of repairs, but this did that necessarily the property pro pecuniary profit. In this relation t of occupation was significant. A n pied a house because he wanted a his head; many properties were oc public authorities with quite other view than that of profit earning. other hand, the only reason why son ties were occupied was to carry on ful trade," and if this could not b on, the "rent at which the proper reasonably be expected to let" was and prejudicially affected.

The lecturer pointed out th "special properties" were the cr Statute, so that they must be va rating purposes with all the advant disadvantages which Parliament had to give or impose. In the definiti rent at which the property might r be expected to let from year to y expression "year to year" must n terpreted as meaning that the hy letting was for one year only, but it translated as meaning that the te capable of enjoying the property fo definite time, and that the tenancy which it was expected would con more than a year, but that it coul minated by notice. The effect of su struction was that the rateable value the fluctuations of the market, subje five-year period in London, and the fixed at arm's length by the higgli market.

The effect and importance of the ing out of the School Board case School Board for London)," that am tenants for the property must be inc possible tenants, including the ten owner himself" was stressed. pointed out that all economic value posed demand, and that if the pos mand to rent a property was limited way, perhaps by excluding the te whom the property made the greates the letting value would be very kept down, if it were not extinguished

A point often overlooked, was that tain unimportant exceptions arising o Rating Act of 1874, a Rating Valua never the ascertainment of a fact: it ways an estimate of reasonable expe the rent at which the property migh ably be expected to let.

USE OWNER'S LIABILITY TO WORKMAN EMPLOYED BY A TENANT

E decision of the Court of Appeal in liffe *v.* Clients Investment Company, Ltd. 2 K.B. 746) is one of importance to ords, tenants, and workmen alike. The dants were assignees of a lease for 90 years December, 1887, of certain premises ding a block of flats. Under this lease defendants were by covenant bound to the premises, both interior and exterior, od tenantable repair. On March 31, 1923, defendants had leased to one Stanley win, for a term of 14 years, a suite of rooms e first floor of the above premises, and under ublease the tenant was to keep the interior e premises in good and tenantable con-n, but he was under covenant to allow the dants and all persons authorised by them nter the premises for various purposes, ding repairing the exterior of the premises. lat in question had a bay window opening ards and a balcony with a coping sup-d by columns and small bath-stone pillars. balcony was 12 to 18 in. in depth. firm of builders and decorators was em-d by the tenant, Mr. Sherwin, to do in decorative work in the flat, and this commenced work on March 27, 1923. may observe that this apparently was the decorative work which the tenant l be under covenant to keep in repair the lease of the flat, but decora-work done with the knowledge of the dants and towards which they were also ibuting, and no doubt undertaken before tenant had gone into actual physical ation. The firm employed had fixed an tisement board which weighed some s. in front of the balcony, and when the was completed a workman in the employ e firm, on May 8, went to take the board but as he was doing so the whole of the g between the columns, and two or three e pillars gave way and the man fell into reet and was killed.

s action was brought by his widow under Campbell's Act, claiming damages for his

ore going further we should note that at rial a question was raised whether the ay did or did not form part of the demise tenant of the flat, and the learned trial had found that it was not so demised but e by the tenant was "an appurtenance the defendants were bound to repair as a n of the exterior of the premises. The of Appeal did not disturb that finding. llowing questions had been left to the jury nswered as follows :—

Was the balustrade at the time of the nt dangerous for persons using the y ?—Yes.
Was the danger apparent to anyone using lcony ?—No.
Did the defendants know, or ought they e known the condition of the balustrade ?

Did the balcony at the time of the accident ute a trap to the deceased ? That is, a concealed danger ?—Yes.
Was the deceased guilty of any want of using the balcony as he did ?—No.
Is it the usual custom of builders and tors to exhibit a signboard ?—Yes.
Did the defendants' servants know that board was being exhibited ?—Yes.
Did the balcony give way in consequence the deceased leaning against it to lower ard ?—Yes.
Damages ?—£1,250.

he appeal the real question was whether ceased man as regards the defendants mere licensee or an invitee, and broadly g the distinction between the two is The licensee must take the premises as s them, except he must not be subjected ncealed dangers, whereas the invitee, easonable care on his part for his own is entitled to expect that the owner or occupier will take reasonable care to prevent damage from unusual danger of which he knows or ought to have known. (Indermaur *v.* Dames, L.R. 1 C.P. 274, affirmed L.R.2 C.P. 311.) The position of these two classes of persons was considered by the House of Lords in the case Fairman *v.* Perpetual Investment Building Society (1923 A.C. 74), which we noted and commented upon (*The Builder*, March 30, 1923). That case was brought by a "stranger" to the landlord of the premises, as she was the sister of the wife of the tenant, and she was held to be a licensee, but the danger complained of was not a hidden danger but was obvious (which distinguishes that case from that we are now considering) and, therefore, the plaintiff failed in the action. That case was much discussed, however, in the case we are considering because it was contended that two of the noble Lords who had delivered opinions in Fairman's case had somewhat extended the law as decided in previous cases by saying that a licensor would be responsible for exposing a licensee to a hidden danger of which he knew "or ought to have known," and this would place the owner or occupier in the same position towards a bare licensee as towards an invitee so far as a hidden danger was in question. Lord Justice Bankes, in the case we are considering, deals with this contention, saying that in Fairman's case it was unnecessary to enlarge the liability of an occupier towards a bare licensee, and it did not appear that any of the members of the House of Lords intended to make any alteration of the law in that respect, and in any case it was not necessary in this case to consider the point, as here the plaintiff was more than a bare licensee.

We will now consider the judgments delivered in the case under consideration by the Court of Appeal. In the first place, what was the position of this workman ? Lord Justice Bankes, as reported, thus described his position : "He was upon the demised premises doing repairs in which both the tenant and the landlord were interested, for though the tenant was the one to give the order, the landlords were responsible to him for part of the cost." Lord Justice Scrutton put it thus : "He was allowed by the tenant to be upon the premises for the purpose of doing repairs, and so far as access to the balcony was necessary for that purpose he was there with the consent of the landlords," and both Lords Justices then describe him to have been "a licensee with an interest." Lord Justice Bankes then is reported as saying a licensee with an interest has the same rights as an invitee, and comes within the rule laid down in Indermaur *v.* Dames set out above. Lord Justice Scrutton took the same view that a licensee with an interest has the same rights as an invitee, and comes within Indermaur *v.* Dames, but in his judgment he considers a good many decided cases, and refers to them as summarised in a judgment delivered by himself in Hayward *v.* Drury-lane Theatre (1917 2 K.B. 899), and it is there shown that a further distinction may be made in the case of invitees, *i.e.*, between persons visiting the premises on invitation, and those doing so for payment. The former come within the rule laid down in Indermaur *v.* Dames, the owner or occupier must take reasonable care to protect him by warning or precautions from traps or unusual danger which he knew of or ought to have known of, but as against dangers which are not traps in this sense they are under no liability, they do not warrant the premises as safe, or as safe as reasonable care can make them, but where payment has been made Lord Justice Scrutton puts the case higher, for there the owners or occupiers must see that the premises are reasonably safe, and if they are not safe and the owners could know of the dangerous condition and negligently did not know of it they are liable for damages caused. The authorities quoted for this last proposition being Mersey Docks Board *v.* Gibbs (1866 L.R. 1 H.L. 93) and Parnaby *v.* Lancaster Canal Co. (1839 11 Ad. & E. 223).

In this case it will be seen the man was held to fall into the category of a licensee with interest with the right to protection of an ordinary invitee. It only remains to mention one further point : In the Court below the judge was asked to hold that there was no evidence on which the jury could have answered the third question as they had done, that the defendants knew or ought to have known the condition of the balustrade. The trial Judge on this point is reported as having said : "It is not for me to say in what way I should have answered that question. There was undoubtedly evidence given on behalf of the defendants which would have warranted the jury in answering 'No,' especially when they answered 'No' to the second question" (that was, that the danger was not apparent to anyone using the balcony) "but on the other hand there was evidence given for the plaintiff from which the jury may have thought that a proper supervision by the defendants would have made the defects in this balcony or balustrade apparent."

The evidence as given in the report was that the coping and pillars had suffered from exposure, that one of the pillars had been repaired by a spigot, and that three others were cracked and that the cracks were discoloured by age. There was also evidence that the defendants employed builders once a month to clean out gutters on the balconies, and had given them instructions to inspect the building and report any want of repair. On this part of the case the Court of Appeal held that as the balcony was made of bath-stone and there were cracks in it there was evidence to support the finding of the jury.

MORTGAGEES AND THE RENT ACT

A SHORT point may be noted which was decided in the case Evans *v.* Horner (*Weekly Notes*, November 29), with reference to a mortgagee's right to foreclose. The mortgage in question was for £600 with interest at 4 per cent. payable on May 19 and November 19. The half-yearly sum of interest due May 19, 1924, had not been paid, and on June 11 the plaintiff, the mortgagee, had taken out an originating summons asking for an account of what was due under the mortgage, and to have the security enforced by foreclosure. On June 14 the defendant, the mortgagor, sent a cheque for the interest overdue, and this was accepted by the plaintiff on account generally. The defendant contended that this payment prevented the plaintiff from continuing these proceedings, relying on section 7 of the Rent Act, 1920.

That section provides : "It shall not be lawful for any mortgagee under a mortgage to which this Act applies so long as (*a*) interest at the rate permitted under this Act is paid and is not more than 21 days in arrear . . . to call in his mortgage or to take any steps for exercising any right of foreclosure or for otherwise enforcing his security or for recovering the principal money thereby secured." The defendant, relying upon Welby *v.* Parker (1916, 2 Ch. 1), contended that if at the time any "steps" were taken for exercising the right of foreclosure the conditions prescribed in the section had been performed the plaintiff could not proceed, and here the subsequent payment of interest had performed the conditions. It may be noted the payment of the half-yearly interest was the only condition in question. The Court held that the meaning of section 7 (*a*) was that mortgagees could not take any "step" so long as interest was paid not later than 21 days after it was due, but here the interest had not been paid within that time and the plaintiff was entitled to judgment.

We may note that in Welby *v.* Parker the Court of Appeal held that both attending on a summons and giving a notice of appeal from the decision given on a summons were "steps" within the meaning of the section.

YORKS BUILDING TRADES EMPLOYERS

THE annual meeting of the Yorkshire Federation of Building Trades Employers was held recently in Leeds Town Hall. The chair was taken by Sir Edwin Airey, who was elected president of the Federation in succession to the late Mr. T. E. Taylor.

During the discussion reference was made to the efforts that were being put forward, locally and nationally, by both employers and employees, to overcome the shortage of skilled labour. It was hoped that the steps that were now being taken would lead towards a solution of the problem. Owing to varying rates of pay and labour conditions, the question, it was stated, bristled with difficulties, and complaint was made of the policy of local authorities, large engineering works, and concerns which were not in the building trade, employing building labour direct. Such people, it was stated, took no part in the training of apprentices, the same applying to small house builders. Consequently builders were having to train apprentices for the whole of the trade.

Reference was also made to the question in the annual report of the Federation. After alluding to the scheme of the National Building Industry Committee for an intensive course of craft training suitable for persons over 18 years of age, the report stated, "The wages paid to apprentices who enter the trade in the normal way should usually be those laid down in the working rules. . . . The best method of overtaking the scarcity of skilled labour is for the employer to take his full quota of indentured apprentices, and to see that these are thoroughly and quickly trained. It is possible that the Government will make it an essential condition of the grant of the subsidy or of the acceptance of a tender for house construction under a scheme instituted by a public authority, that the successful contractor shall undertake to employ and train a definite quota of adult apprentices as a condition of acceptance. The Yorkshire working rules provide that each employer shall be allowed one apprentice and an additional apprentice to every four men employed in that particular branch, with a maximum number of seven to each section. Every member should train the full complement of apprentices allowed under the rule. The Federation recommend that the number of apprentices should be based on the number of craftsmen employed in the district, and not in individual workshops; and that the number allowed be based on the proportion of one apprentice to three craftsmen."

With reference to output, the report stated that the paralysing effect of reduction in output with the uneconomic high wage had had a cumulative effect upon building costs, and was unquestionably deterring many clients from undertaking building work. The experiments which took place recently in Rotherham, where a bricklayer laid 809 bricks per hour, and another bricklayer 750 bricks per hour, had demonstrated that bricklayers could undertake the laying of many more bricks per day without serious physical effects, and it was to be hoped that the appeal for the loyal support of building employers and operatives to overtake urgent housing needs would result in every one realising that it was their bounden duty to give a fair day's work for a fair day's pay.

An aspect of the building strike during last summer was commented upon. "During the strike," the report stated, "many co-operative societies exploited the situation by tendering for and undertaking building work. The keen competition of co-operative societies outside their recognised legal and well-established customs calls for immediate attention and legislative adjustment. It is unfair that private enterprise should be hampered and harassed by heavy taxation, while co-operative societies, immune from similar taxation, should be placed in a preferential position to unfairly compete with private enterprise. It is submitted that there is a duty upon the Government to place all building trade employers on an absolute equality as regards taxation, and if this is done allied employers have no reason to fear the competition of co-operative societies."

MARKET HARBOROUGH.—The U.D.C. is urging that the subsidy should be increased from £75 to £100 in order to encourage private enterprise, and that the superficial area should be increased of houses ranking for subsidy.

MERIONETH.—The C.C. suggests united action by county authorities in North Wales for the provision of a colony for about 500 mental deficients.

MIDDLEWICH.—The U.D.C. proposes to widen the town bridge, at a cost of £16,000.

NEWTON ABBOT.—The R.D.C. passed plans: Bungalow, at Maidencombe, for Mrs. Malden; pair of bungalows, at Ogwell, for Messrs. Carpenter and Mayne; pair of bungalows, at Wynne estate, Maidencombe, for Mr. H. C. Powell.—The cost of rebuilding the G.W.R. Station will be £247,000.

PLYMOUTH.—Plans have been submitted for alterations, Little Efford Open Air School for increasing the accommodation by 50 places and for improving the premises generally for school work, and estimated to cost £2,740.—The Borough Surveyor submitted plans and estimate of £21,659 for erecting 22 houses containing 44 flats and for laying out paths and drains, &c., at "Stonehall." East Stonehouse, which were approved.—Plans passed by T.C.: E. Hill, two houses, Fircroft-road; E. J. Elliott, two houses, Milne-place; Mrs. G. A. Wollacott, house, Tavistock-road, Milehouse; —. Rendle, house, Coleridge-road; Hayter & Coles, two houses, Lanhydrock-road; F. Downard, two houses, Carmarthen-road; M. L. Finch, house, Lower Compton-road; J. A. Blatchford, three houses, Old Laira-roap; Plymouth Properties, Ltd., new urinal and w.c., Royal Hotel.—Messrs. Hennell & James, 19, Russell-square, London, have been appointed architects for the Lady Astor housing scheme.

PORTLAND.—A new school is to be erected on a site at Tophill.

RAWMARSH.—The U.D.C. has accepted tenders for the erection of 75 houses on the Haugh-road site, at £475 per house, within eight months. Local builders are to be approached with a view to the erection of a further 25. Application is to be made to the M.H. for sanction to borrow £47,500. The M.H. have provisionally sanctioned a loan for public baths.

SCARBOROUGH.—The Corporation has decided to construct medical baths on the Sarony-square site on the South Cliff.—The Valley Bridge is to be widened and reconstructed at a cost of about £130,000. The M.T. has granted £85,000 towards the scheme.

SEATON SLUICE.—Important building developments are pending at Seaton Sluice so soon as the new L.N.E.R. branch line from Monkseaton has been completed.

SHIPLAKE.—A £3,500 village hall is to be erected.

SMETHWICK.—The T.C. passed plans:—Convenience at the Crystal Palace, Cranford-street, for Showells Brewery Co., Ltd.; sub-station, Cape Hill, for the Shropshire, Worcestershire and Staffordshire Electric Power Co.; 12 houses, Bertram-road, for W. Lees.

SOUTHALL.—A large site in Southall, Middlesex, has been purchased by the Cambrian Coaching and Goods Transport Co., Ltd. The company propose to cover an area of about 70,000 super feet with buildings. A steel-framed building has been designed with brick walling and a "north light" roof of asbestos cement tiles and patent glazing. The floors will be of concrete, except for those in the factory and shops, which will be partially covered with wood. The architects are Messrs. George Hubbard & Son, of 45, New Bond-street, London, W.1.

SOUTHEND-ON-SEA.—Work has recently been initiated and excavation for the foundations are in hand on the site of the new Westcliff Secondary School, which is to cost about £60,000. The general contractor is Mr. J. E. Gray, of Broad-street, Coventry, whose estimate of £49,134 was accepted. The architects are Messrs. H. H. Thompson & Co., of 8, Market-place, Leicester.

SUNDERLAND.—The Seamen's Mission has secured a promise of £3,000 towards the cost of the new institute which it is proposed to erect in the town.

SWANSEA.—Plans passed by the T.C.: Factory, South Dock Embankment, for Mr. W. Jones; Bungalow, Salem-road, for Mr. Owen Rees; house, Cefn-road, Glais, for Mr. Thomas Richards; bungalow, Gower-road, for Mr. S. B. Burgess; bungalow, Bays-

* See also our List of Contracts, Competitions, etc.

water-road, Tycoch Estate, for Mr. D. A. Williams; three houses and lock-up shop, Danygraig-road, for Messrs. L. Owen & Son; house, Murton, for Mrs. M. Barrow; house, Glanmor-park, for Mr. W. H. Waller; house, Clydach-road, for Mr. Dd. Hopkins; bungalow, White Stone-lane, Newton, for Mr. Dd. Davies; two houses, Townhill, for T. & G. Spragg; house, Tycoch Estate, for Mr. J. A. Davies; house, Tycoch Estate, for Mr. F. J. Bebb; house, Monterey-street, for Mr. D. T. Thomas; house, Cecil-street, for Mr. H. H. Taylor; house, Waunwen-road, for Mr. D. H. Davies; bungalow, Hendrefoilan-road, for Mr. J. Coffey; house, Goitre-fach-road, Killay, for Mr. L. C. Grimshaw; house, St. John's-road, for Mr. W. R. Crosby; house, St. John's-road, for Mr. T. Richards; house, St. John's-road, for Messrs. Weaver Bros.; house, St. John's-road, for Mr. D. J. Lewis; two houses, Pentregethin-road, for Messrs. Harris & Macleod; two houses, Pentregethin-road, for Messrs. T. Williams & Son.

THORNTON (LANCS).—The U.D.C. are seeking sanction from the M.H. for the borrowing of £5,000 for the purpose of carrying out extensions at the Council offices.

THUNDERSLEY.—Essex C.C. has decided to provide additional elementary school accommodation by direct labour, at a cost of £1,659.

THURNSCOE.—The U.D.C. has acquired a site comprising 27 acres adjoining the present Council scheme upon which it is proposed to erect 50 houses. Sanction of the M.H. is being sought.

TROWBRIDGE.—The U.D.C. passed plans: Messrs. E. Linzey & Son, four houses in Bradford-road.

TRURO.—The T.C. passed plans for a house at the Crescent, for Mr. Russell.

UPMINSTER.—The parishioners of Upminster are raising a fund for the enlargement of the parish church, which will cost about £4,000. Sir Charles Nicholson has submitted plans.

WAKEFIELD.—The T.C. passed plans: Bell & Kay, two houses in Thornes-road, for J. W. Easter and B. Buckland; Bell & May, two houses in Cross-lane, for Messrs. Kilkenny Bros.; Bell & Kay, house in Thornes-road, for Mr. H. Campbell.

WELLEY (NORFOLK).—The M.T. is expected to contribute one-half of the cost of £15,000 involved in the construction of a new bridge.

WEST BRIDGFORD.—Plans passed by U.D.C.: Three houses, Blake-road, for Messrs. West & Cross; house, Rutland-road, for Mr. Haskard.

WILLINGTON.—The U.D.C. has prepared a scheme for erecting 60 houses.

WOKING.—It is proposed to add to the buildings of the St. Peter's Harbour Nurses' Home at Woking and to erect a new wing and a small chapel. The new additions will be of brick construction, the roofs being tiled. The cost is estimated at £6,000. Plans have been prepared by Messrs. John & Paul Coleridge, architects, of 14, North Audley-street, London, W.1.

WOLVEY.—A teacher's house is to be erected at a cost of about £750 by the Warwickshire E.C.

TRADE NEWS

Messrs. N. Gerver, 8–10, Mare-street, Hackney, E.8, will be pleased to send their 1925 almanac to anyone sending their trade card.

Messrs. Christmas & Walters, Ltd., of Caxton House, Westminster, inform us that subsequent to a recent order from the High Commissioner for India for 38,000 sq. ft of Blawforms, they have received a repeat order for an additional 12,000 sq. ft. These forms will be used by native labour under native gangers, their design being of such a simple nature that unskilled labour only is required for handling them.

We have received from Mr. A. L. Curtis, Westmoor Laboratory, Chatteris, a copy of his catalogue of industrial sands. It gives interesting details of the innumerable varieties of sand which have commercial values. Mr. Curtis claims to supply every variety of sand, and it may surprise many people to know there are as many as 77 different kinds used for industrial purposes, apart from the varieties which can be supplied for foundry work, glass manufacture, water filtration, pottery work and other purposes. The catalogue has many illustrations and should prove invaluable to all users of sand.

We have received from Messrs. Smart & Brown, Erith, Kent, a descriptive catalogue dealing with their "S. & B." motor winches. It is fully illustrated, and it can at once be seen that the word "simplicity" is fully justified in describing these winches. The fact that a letter of appreciation with regard to their various appliances was received from the War Office during the war is, we think, proof positive of their engineering efficiency. The "Simplicity" winch, they state, can be used by the most inexperienced person in a few minutes. Builders should note that it can be worked by the man on the scaffold who lands the load; and is suitable for working spoon dredgers, also for hauling trucks in chalk, sand or gravel pits. For pile driving they claim it is ideal, taking up little space and being quick in action.

NEW BUILDINGS IN LONDON

London.—The Congregational Union propose to erect a memorial building dedicated to the late Dr. Clifford. The building will take the form of a Sunday school, an institute and other church buildings on a site in Westbourne Park, W.2. The new premises will be faced with best quality brick and relieved with stone dressings. It will have a pitched roof of slates. The floors will be of wood blocks and the interior will be divided up into classrooms by glazed and boarded partitions. Heating plant, supplied by an outside boiler-house, and electric lighting will be installed, the total cost of the building being estimated at £15,000. The architects are Messrs. Spalding & Myers, of 12, New-court, London, W.C.2.

Peckham.—A new covered-in market is to be built at Rye-lane, Peckham, S.E., for a company called the Peckham Arcade, Ltd. The building will be of brick with a roof of glazed louvres and corrugated asbestos cement sheets, supported on a steel framework, and will cover an area of 8,000 sq. ft. Stalls will be fitted around the walls inside, with a double row of shops along the centre. The floors will be of concrete, covered with granolithic paving. Breeze slabs will be used for partitioning. Collapsible gates will be fitted at the entrances. Electric lighting will be provided and drains laid on. The architects are Messrs. Cannell & Goummant, of 259, High Holborn, London, W.C.2.

Ilford.—New premises are to be built in the High-road for Messrs. Harrison, Gibson, Ltd., general furnishers. A new block of four stories in height is to be carried out in brickwork faced with terra-cotta. Steel frame construction will be adopted and the floors will be of hollow tiles reinforced with steel bars. The ground floor will be used for shop display fronts and will include a large arcade. There will be a frontage to the High-street of about 80 ft., the building extending back about 130 ft. The roof will be flat, constructed of reinforced concrete and asphalted. Central heating, electric lighting, ventilating and pneumatic cash tubes, and a passenger lift and a goods hoist will be installed. The contractors are Messrs. Clemens Bros., Ltd., 77, Derby-road, E.7. The architects are Messrs. C. J. Dawson, Son & Allardyce, Clock House Chambers, Barking, Essex.

King William-street.—Building work will be in progress shortly on another site in King William-street, E.C.4, where the Caledonian Insurance Company, of Edinburgh, intend to provide new London offices. A modern block will be erected reaching a height of about 80 ft. and covering a street frontage of 50 ft. There will be six floors and a basement, the whole of which will be of fireproof construction. The building will have a Portland stone front and will be supported by a steel framework. The window casements on the ground floor will be of ornamental bronzework, whilst above they will be of cast-iron and steel. The rear walls will be of white glazed brick and the roof will be flat and of concrete covered with asphalte. A lift will give access to all floors and central heating and electric lighting will be installed. Vacuum cleaning apparatus will also be fitted. Marble will be used for flooring and skirtings, &c., in the main entrance, and wood block flooring is specified. The builders are Messrs. Howell J. Williams, Ltd., of 11, Bermondsey-street, S.E.1. The architect is Mr. Arthur Blomfield, M.A., of Grocers' Hall, Princes-street, E.C.2.

Tower Bridge-road.—A block of buildings, consisting of shops with flats above, is to be erected on a site in Tower Bridge-road, S.E.1. Having a frontage of 200 ft. and a superficial area of 12,500 ft., the premises have been designed as a three-story block, built of red brick, with artificial stone dressings. The floors will be of concrete finished with granolithic. The roof will be flat and asphalted. Mahogany shop fronts will be fitted, to suit individual tenants. The architects are Messrs. North, Robin & Wilsdon, 35–39, Maddox-street, W.1, acting on instructions from Messrs. Edward Mortimer (London), Ltd., 9, New Bridge-street, London, E.C., the owners.

FIRE PRECAUTIONS.

The following extracts are from a pamphlet recently issued by the National "Safety First" Association :—

(1) Erect buildings of fire-resisting construction or as substantially as possible. Reduce their cubical capacity and height to the minimum and protect them from fires breaking out in adjacent premises.

(2) Avoid openings in floors, and if they are necessary, protect them as stated.

(3) Refrain as far as possible from allowing open spaces between buildings to be occupied by sheds, &c., of inferior construction, or as dumps for timber, crates and the like.

(4) When extending buildings guard against the extension of a fire.

(5) Light your premises efficiently. Do not let there be any dark corners. Authorise a responsible man to light up and to look after the installation. Use automatic lighters for gas, protect inflammable ceilings over gas burners, and combustible material in the neighbourhood of swinging gas brackets. Do not place electric bulbs in contact with inflammable materials. Give instructions for the maintenance of these safeguards.

(6) If electric lighting is used, do not permit extension or alterations of any kind except by an efficient electrician.

(7) Give special attention to the protection of combustible material in the neighbourhood of any heating device, whether for a trade process or for warmth.

(8) Remove all waste from the buildings every night and burn or otherwise dispose of it in a safe manner. The use of metal receptacles with lids for the temporary deposit of oily or greasy waste is essential.

(9) Keep the premises scrupulously clean and tidy and avoid overcrowding of any description

(10) Do not allow unauthorised persons to gain access to your premises.

(11) Keep your stock in buildings not occupied for hazardous trade processes and do not keep it all in one building if you have sufficient accommodation.

(12) Advise your insurance company *before* you make structural alterations, or before you introduce new fires or gas-heated appliances or a different method of lighting.

THE SCOTTISH BUILDE

WORKMEN'S DWELLINGS

At the annual meeting of the Glasgow Workmen's Dwellings Company, Sir Daniel M. Stevenson, who presided, said there were many inhabitants of Glasgow—in fact, in all big towns—who did not require houses of three apartments, and who would find three apartments a great encumbrance. The policy of the Glasgow Corporation at the moment, in the opinion of some people, was erroneous, in the sense that it did not take into consideration the position of single women, who would be completely hampered with two or three rooms to look after. It was probable that for many years to come there would be a need for a minimum of two apartments, as the minimum of three or four apartments was unnecessary meantime. With regard to the general question of housing policy, daylight would not be seen for two or three years yet. The people concerned in the question were groping for a definite policy, and as the new Government were apparently going to have a long lease of power they might have a fair policy worked out. On Sir Daniel Stevenson's motion, seconded by Mr. Arnold Fleming, the annual report of the Company was approved. Mr. John Dallas said the Glasgow Corporation had not been providing the houses which were required at all. From 1921 until 1924 they had erected about 4,000 houses, chiefly of three, four, and five apartments. They had made no provision at all for those who lived in one room and kitchen houses, although of 236,000 houses in the city 112,000 were of the one room and of the kitchen type.

Kirkcudbright County Offices.

At a recent meeting of the Stewartry County Council, held at Kirkcudbright, the Finance Committee reported on the provision of offices for the County Council and its officials at Kirkcudbright. The committee reported that their present accommodation for county officials is inadequate, but recommended that before deciding as to the erection of new county buildings authority be given to the committee to employ an architect to draw up a plan providing for the accommodation of all essentially County Council officials. The report was adopted, and it was also agreed that the ques of accommodation at Castle-Douglas considered.

Glasgow Ice Rink.

Further particulars of the scheme to erec ice rink in the centre of the city were rece issued by Colonel Robertson-Aikman, the cl man of the committee, and Mr. James Gou the secretary. The sum required to build a rink on a site bounded by West Regent-s and Pitt-street and Jane-street is £50,000 plan of the proposed building has been prep by Messrs. Watson, Salmond & Gray, F.R.I.I West George-street.

Steel Houses.

With regard to the two experimental steel houses which the Glasgow Corporatio erecting at Drumoyne, the Scottish Counc the National Federation of Building T Operatives recently informed the Hou Committee that building trade conditions r be observed on the work if the erection of houses was to proceed. The Committee dec to write to Messrs. Weir that these condit must be observed. By the Standing Or of the Corporation, trade union wages r be paid on all contracts given out.

Glasgow Art Club.

At the annual meeting of the Glasgow Club held recently, the following office-bea and members of Council in room of t retiring were elected:—President, Alexa Proudfoot, A.R.S.A.; vice-presidents, H Stuart Brown and A. R. W. Allan; treasurer, A. Graham Henderson, A.R.I.B hon. secretary, Henry Y. Allison; membe Council in room of those retiring—Hugh Buchanan, Wm. Smith, jun.; James A John Watson, F.R.I.B.A.; Arch. Daw and A. Haswell Miller, R.S.W.

Aberdeen Building.

The total value of the buildings for w plans were passed in Aberdeen during year ended November 30 was £253,450. pared with £196,781 last year, an increas £56,669. The figures for the preceding t years were respectively £87,025, £119.887 £468,105.

BUILDING TRADE WAGES IN SCOTLAND

The following are the present rates of wages in the building trade in the principal towns Scotland. Every endeavour is made to ensure accuracy, but we cannot be responsible for er that may occur :—
